## Appendix A.1 Comparison of Unknown Densities

We employ the nonparametric statistic test developed by [Li \(1996\)](#) which tests the null hypothesis  $H_0 : f(x) = g(x)$  for all  $x$ , against the alternative  $H_1 : f(x) \neq g(x)$  for some  $x$ .<sup>1</sup> This test, which works with either independent or dependent data, is often used for example when testing whether income distributions across two regions, groups or times are the same. The test statistic used to test for the difference between two unknown distributions (which goes asymptotically to the standard normal, as shown by [Fan and Ullah \(1999\)](#)), predicated on the integrated square error metric on a space of density functions,  $M(f, g) = \int_x (f(x) - g(x))^2 dx$ , is

$$J = \frac{Nb^{\frac{1}{2}}M}{\hat{\sigma}} \sim \text{Normal}(0, 1), \quad (1)$$

where

$$M = \frac{1}{N^2 b} \sum_{i=1}^N \sum_{\substack{j=1 \\ j \neq i}}^N \left[ K\left(\frac{x_i - x_j}{b}\right) + K\left(\frac{z_i - z_j}{b}\right) - K\left(\frac{z_i - x_j}{b}\right) - K\left(\frac{x_i - z_j}{b}\right) \right],$$

$$\hat{\sigma}^2 = \frac{1}{N^2 b \pi^{\frac{1}{2}}} \sum_{i=1}^N \sum_{j=1}^N \left[ K\left(\frac{x_i - x_j}{b}\right) + K\left(\frac{z_i - z_j}{b}\right) + 2K\left(\frac{x_i - z_j}{b}\right) \right],$$

$K$  is the standard normal kernel and  $b$  is the optimally chosen bandwidth.<sup>2</sup>

---

<sup>1</sup>The explanation that follows assumes that  $\{x\}$  and  $\{z\}$  are two equally sized samples of size  $N$ , taken from  $f$  and  $g$  respectively. The extension to unequal sample sizes is trivial.

<sup>2</sup>For further details see [Fan and Ullah \(1999\)](#), [Li \(1996\)](#), and [Pagan and Ullah \(1999\)](#).

## Appendix A.2 Data Envelopment Analysis in practice

Suppose for clarity that we observe 6 countries with the following values of Y, L, and K:

| Country | Y   | L   | K    |
|---------|-----|-----|------|
| A       | 5   | 1   | 2    |
| B       | 4   | 1   | 4    |
| C       | 12  | 1.5 | 9    |
| D       | 7.5 | 1.5 | 10.5 |
| E       | 14  | 2   | 18   |
| F       | 24  | 3   | 42   |

We know that in the CRS case, we can show the input-output relationship in a two-dimensional plot with  $K/L$  and  $Y/L$  axes:

| Country | Y   | L   | K    | $y = Y/L$ | $k = K/L$ |
|---------|-----|-----|------|-----------|-----------|
| A       | 5   | 1   | 2    | 5         | 2         |
| B       | 4   | 1   | 4    | 4         | 4         |
| C       | 12  | 1.5 | 9    | 8         | 6         |
| D       | 7.5 | 1.5 | 10.5 | 5         | 7         |
| E       | 14  | 2   | 18   | 7         | 9         |
| F       | 24  | 3   | 42   | 8         | 14        |

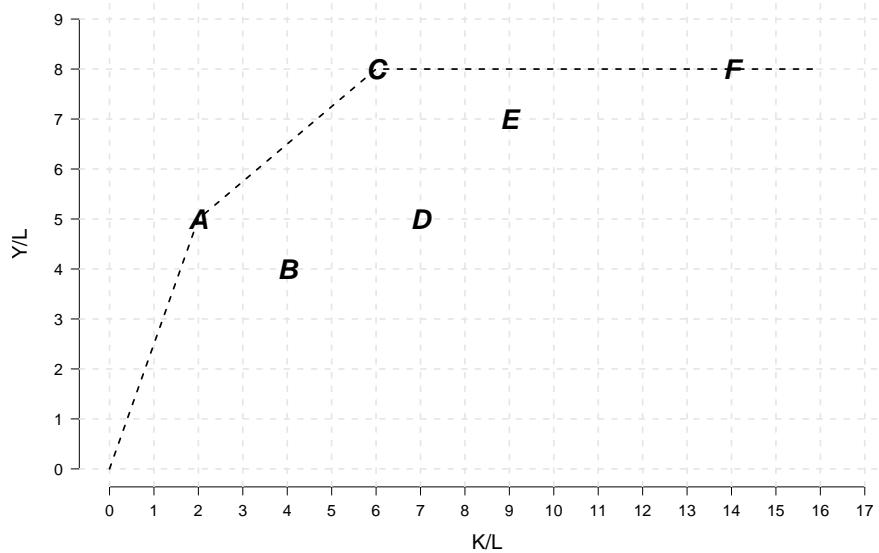

Figure A.1: Hypothetical observations A–F and a production frontier (dotted kinked line)

The DEA efficiency score is the solution to a linear programming (LP) problem solved for each observation  $j$ :

$$\max F^j$$

subject to the following constraints

$$\sum_{i=1}^6 z_i Y_i \geq F Y_j$$

$$\sum_{i=1}^6 z_i K_i \leq K_j$$

$$\sum_{i=1}^6 z_i L_i \leq L_j$$

$$z_i \geq 0$$

Hence for country A the LP problem is

$$\max F^A$$

subject to the following constraints

$$z_1 5 + z_2 4 + z_3 12 + z_4 7.5 + z_5 14 + z_6 24 \geq F^A 5$$

$$z_1 2 + z_2 4 + z_3 9 + z_4 10.5 + z_5 18 + z_6 42 \leq 2$$

$$z_1 1 + z_2 1 + z_3 1.5 + z_4 1.5 + z_5 2 + z_6 3 \leq 1$$

$$z_i \geq 0$$

Analogously, for country B the LP problem is

$$\max F^B$$

subject to the following constraints

$$z_1 5 + z_2 4 + z_3 12 + z_4 7.5 + z_5 14 + z_6 24 \geq F^B 4$$

$$z_1 2 + z_2 4 + z_3 9 + z_4 10.5 + z_5 18 + z_6 42 \leq 4$$

$$z_1 1 + z_2 1 + z_3 1.5 + z_4 1.5 + z_5 2 + z_6 3 \leq 1$$

$$z_i \geq 0$$

We notice that the left hand side (LHS) of the constraints remains the same for all countries. This LHS determines the technology. What changes from country to country are the values of  $Y$ ,  $K$ , and  $L$  for the particular country that appears on the right hand side (RHS) of the constraints, which are benchmarked against the technology that is defined by the LHS of the constraints.

The calculated efficiencies are then given in the last column of the table

| Country | $Y$ | $L$ | $K$  | $y = Y/L$ | $k = K/L$ | TE    |
|---------|-----|-----|------|-----------|-----------|-------|
| A       | 5   | 1   | 2    | 5         | 2         | 1.000 |
| B       | 4   | 1   | 4    | 4         | 4         | 0.615 |
| C       | 12  | 1.5 | 9    | 8         | 6         | 1.000 |
| D       | 7.5 | 1.5 | 10.5 | 5         | 7         | 0.625 |
| E       | 14  | 2   | 18   | 7         | 9         | 0.875 |
| F       | 24  | 3   | 42   | 8         | 14        | 1.000 |

Clearly, countries A, C, and F are on the frontier as their efficiencies are equal to 1. It is also seen in Figure 1.

Now suppose that the country G appears in the sample with values 8.75, 3.75, and 1.25 for Y, K, and L, respectively.

| Country | $Y$  | $L$  | $K$  | $y = Y/L$ | $k = K/L$ |
|---------|------|------|------|-----------|-----------|
| A       | 5    | 1    | 2    | 5         | 2         |
| B       | 4    | 1    | 4    | 4         | 4         |
| C       | 12   | 1.5  | 9    | 8         | 6         |
| D       | 7.5  | 1.5  | 10.5 | 5         | 7         |
| E       | 14   | 2    | 18   | 7         | 9         |
| F       | 24   | 3    | 42   | 8         | 14        |
| G       | 8.75 | 1.25 | 3.75 | 7         | 3         |

The figure tells us that the technology has changed, thus if we write the LP program for country A now

$$\max F^A$$

subject to the following constraints

$$z_15 + z_24 + z_312 + z_47.5 + z_514 + z_624 + z_78.75 \geq F^A 5$$

$$z_12 + z_24 + z_39 + z_410.5 + z_518 + z_642 + z_73.75 \leq 2$$

$$z_11 + z_21 + z_31.5 + z_41.5 + z_52 + z_63 + z_71.25 \leq 1$$

$$z_i \geq 0$$

It is intuitive that country A (the RHS of the new constraints) is now benchmarked against new technology determined by the LHS of the new constraints that now contain country G (addition of the terms with  $z_7$ ).

The calculated efficiencies are then given in the last column of the table

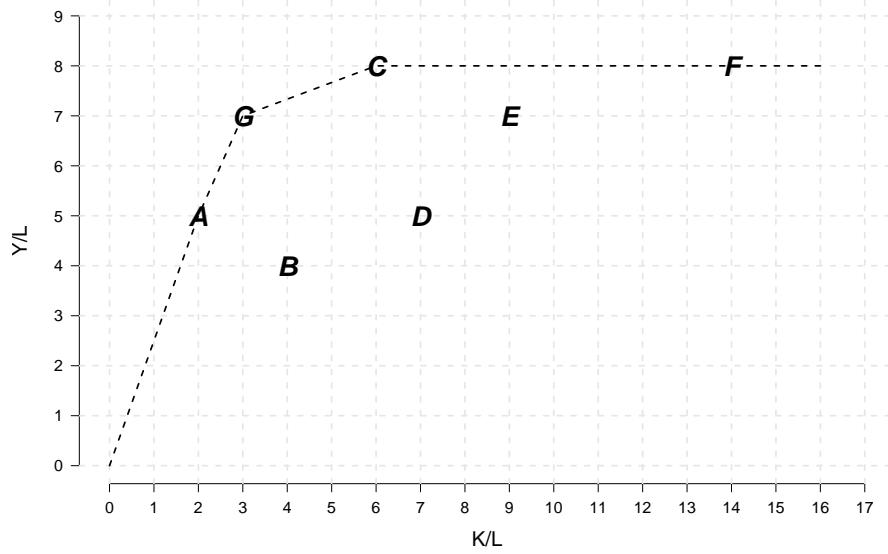

Figure A.2: Hypothetical observations A–G and a production frontier (dotted kinked line)

| Country | $Y$  | $L$  | $K$  | $y = Y/L$ | $k = K/L$ | TE    |
|---------|------|------|------|-----------|-----------|-------|
| A       | 5    | 1    | 2    | 5         | 2         | 1.000 |
| B       | 4    | 1    | 4    | 4         | 4         | 0.545 |
| C       | 12   | 1.5  | 9    | 8         | 6         | 1.000 |
| D       | 7.5  | 1.5  | 10.5 | 5         | 7         | 0.625 |
| E       | 14   | 2    | 18   | 7         | 9         | 0.875 |
| F       | 24   | 3    | 42   | 8         | 14        | 1.000 |
| G       | 8.75 | 1.25 | 3.75 | 7         | 3         | 1.000 |

Here we observe that now countries A, C, F, and G are determining the frontier as their efficiency levels are equal to 1 (see also Figure 2). We also note that the relative position (to the new frontier) of countries D and E did not change, so their efficiency levels remain unchanged. Country B, however, is now further away from the [new] frontier, that is why its efficiency falls from 0.615 to 0.545.

## Appendix B Human capital data

Table A.1: Human capital augmentation factors

| #  | Country        | 1965  | 2005  | #  | Country             | 1965  | 2005  |

| Joint significance <sup>e</sup> | <0.0001             | 0.0001            | 0.0028           | 0.0001            | 0.0021            | 0.0004            |

<sup>a</sup> The dependent variable is the log of the inverse of the financial efficiency measure. The coefficients on the financial development regimes (regions) represent the sum of coefficients and the respective numbers below the coefficients are p-values for the sum of coefficients

<sup>b</sup> Financial development falls into the low region if its value is lower than the 25<sup>th</sup> percentile of the financial development distribution

<sup>c</sup> Financial development falls into the middle region if its value is between the 25<sup>th</sup> and 75<sup>th</sup> percentiles (inclusive) of the financial development distribution

<sup>d</sup> Financial development falls into the high region if its value is greater than the 75<sup>th</sup> percentile of the financial development distribution

<sup>e</sup> p-value of the F-statistic on the three coefficients on financial development in the main regression.

Table A.3: Financial efficiency augmentation factors

| #  | Country        | 1965  | 2005   | #  | Country              | 1965  | 2005   |

Figure A.3: Distributions of financial development index, 1965 and 2005

*Notes:* Estimated 1965 and 2005 distributions of financial development index. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 2005 distribution and the dashed vertical line represents the 2005 mean value.

Figure A.4: Distributions of efficiency index, 1965 and 2005

*Notes:* Estimated 1965 and 2005 distributions of efficiency index. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 2005 distribution and the dashed vertical line represents the 2005 mean value.

*Notes:* The bold italic abbreviations show the 1965 observations and the normal font abbreviations show the 2005 observations. The dotted line represents the 1965 production frontier and the solid line presents the 2005 production frontier.

\* OECD countries as of 1990.

\*\* Japan, Malaysia, Singapore, and Thailand.

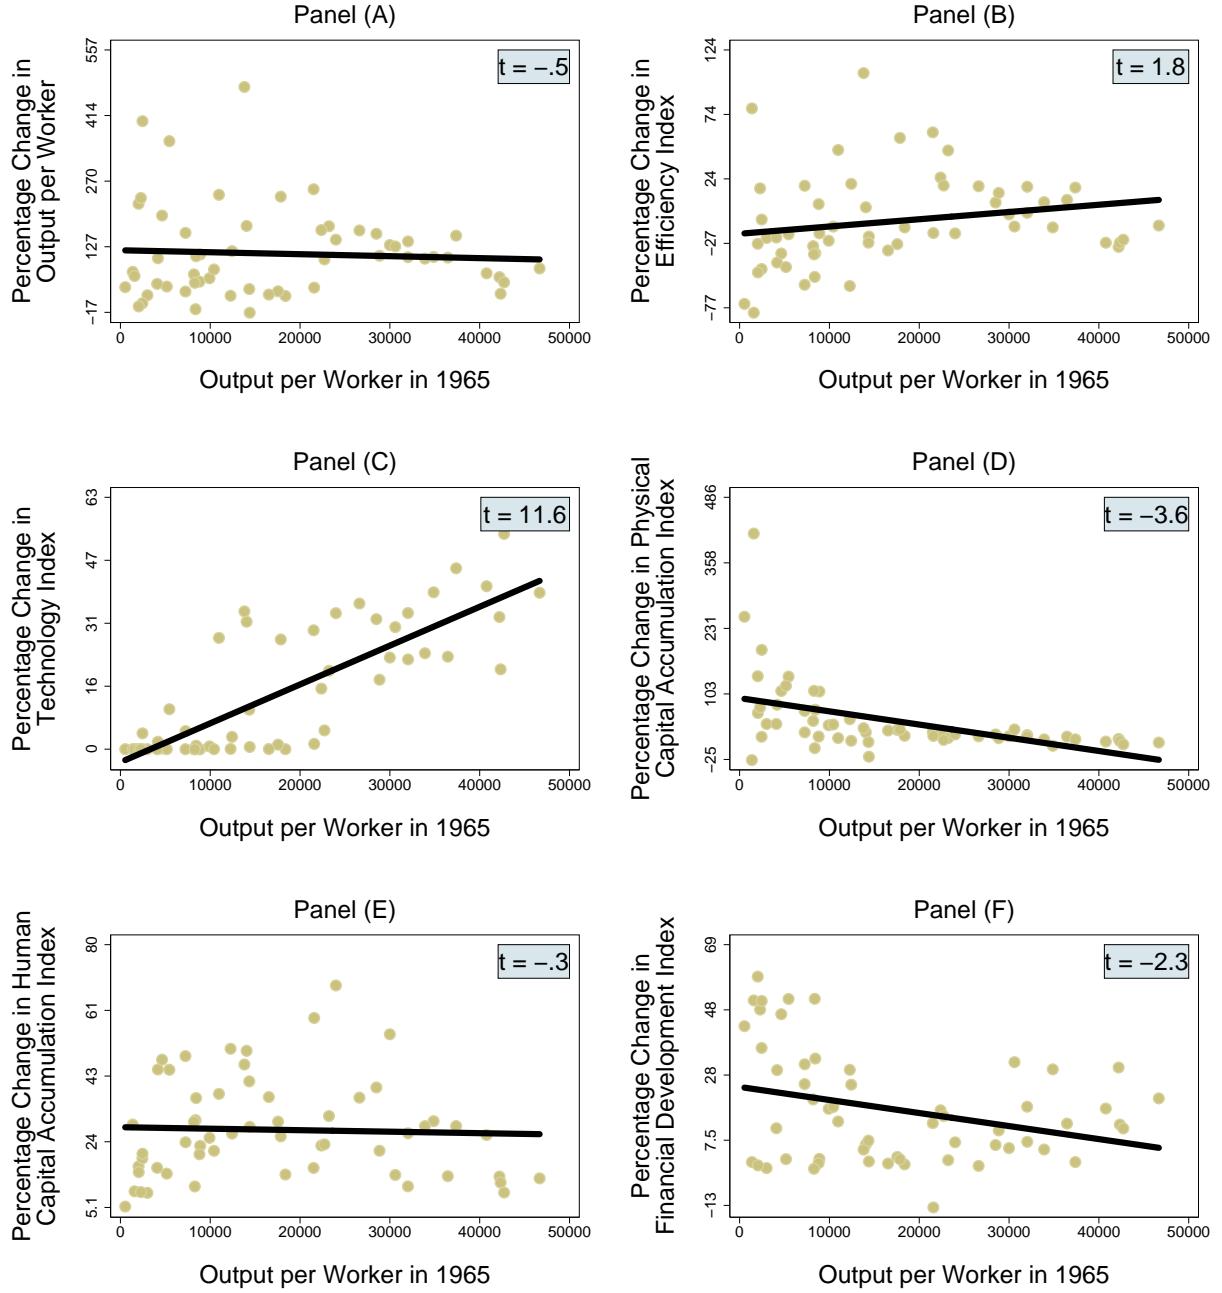

Figure A.6: Percentage change (from 1965 to 2005) in output per worker and five decomposition indices, plotted against output per worker in 1965.

*Notes:* Each panel contains a GLS regression line; the top right number in each panel is a  $t$ -statistic of a respective GLS regression based on “heteroskedasticity-consistent” estimators for the variance (Huber (1981); White (1980)).

Notes: We used the bootstrapped Li (1996) test with 5000 bootstrap replications and the Sheather and Jones (1991) bandwidth.

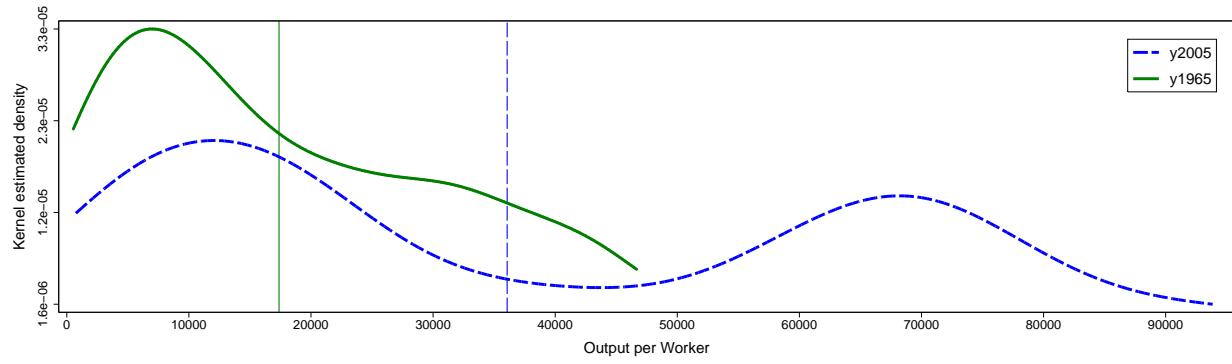

Figure A.7: Distributions of output per worker, 1965 and 2005

*Notes:* Estimated 1965 and 2005 distributions of output per worker. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 2005 distribution and the dashed vertical line represents the 2005 mean value.

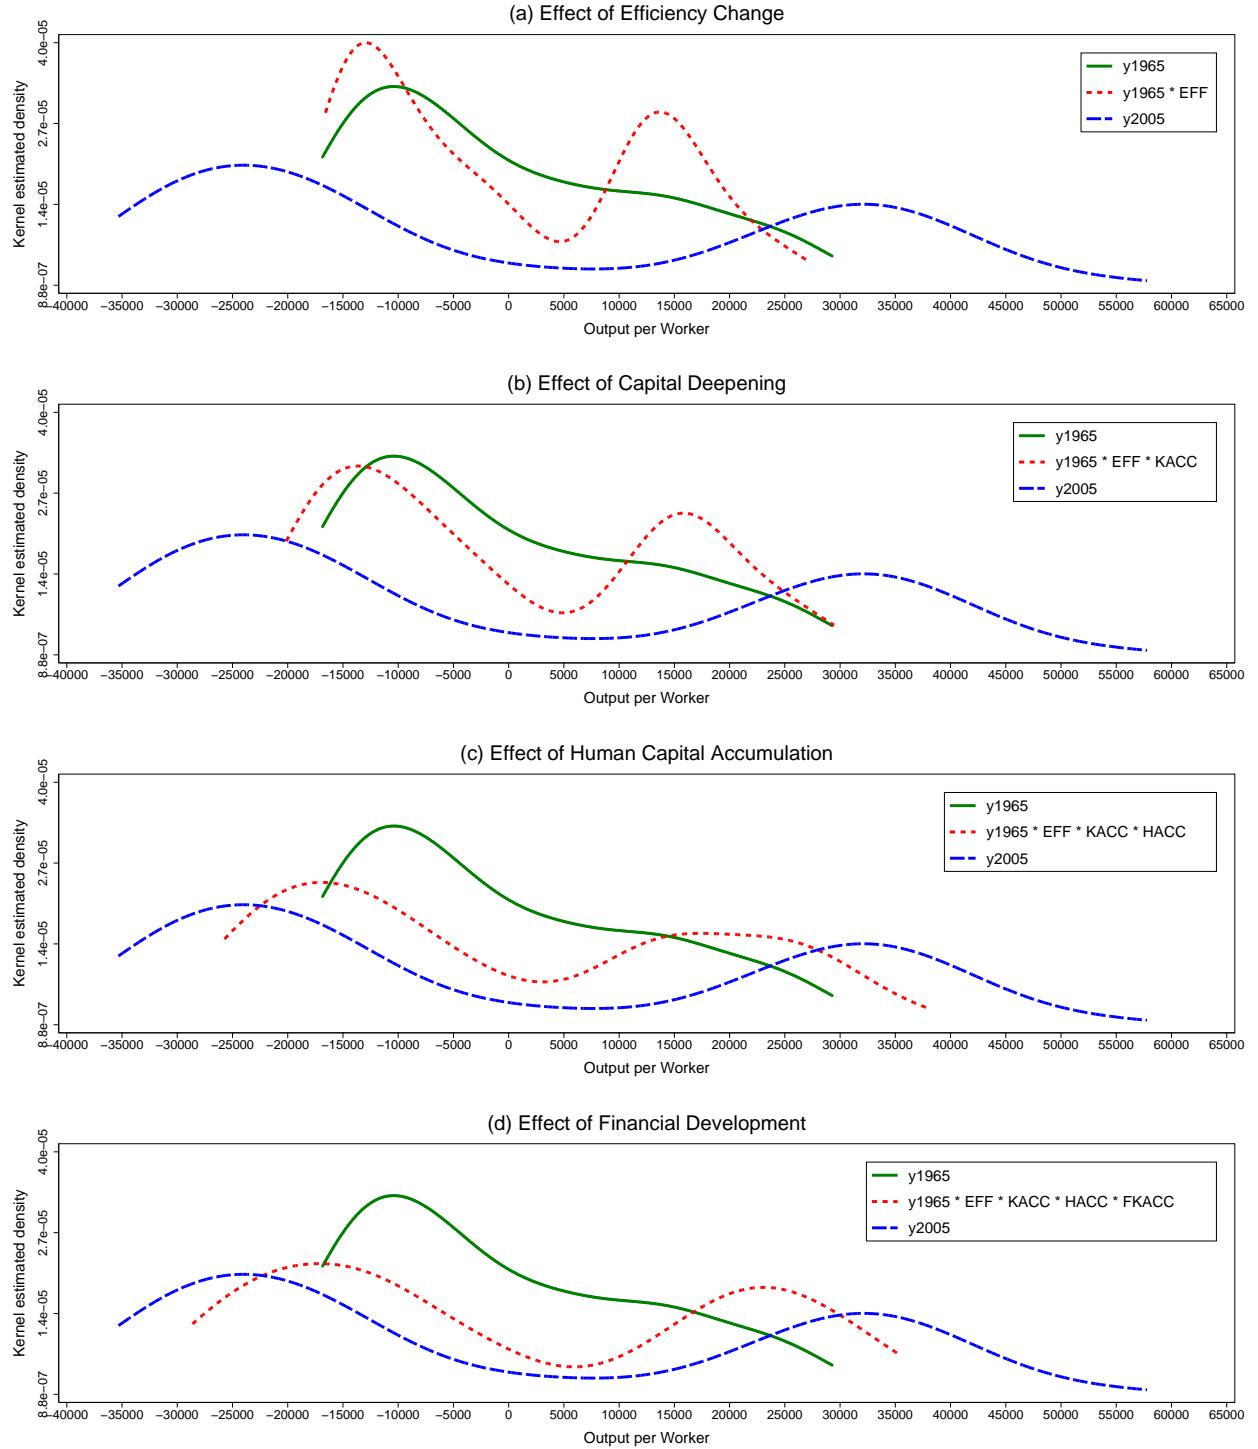

Figure A.8: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: EFF, KACC HACC, and FKACC

Notes: In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of efficiency change, capital deepening, human capital accumulation, and financial development on the 1965 distribution.

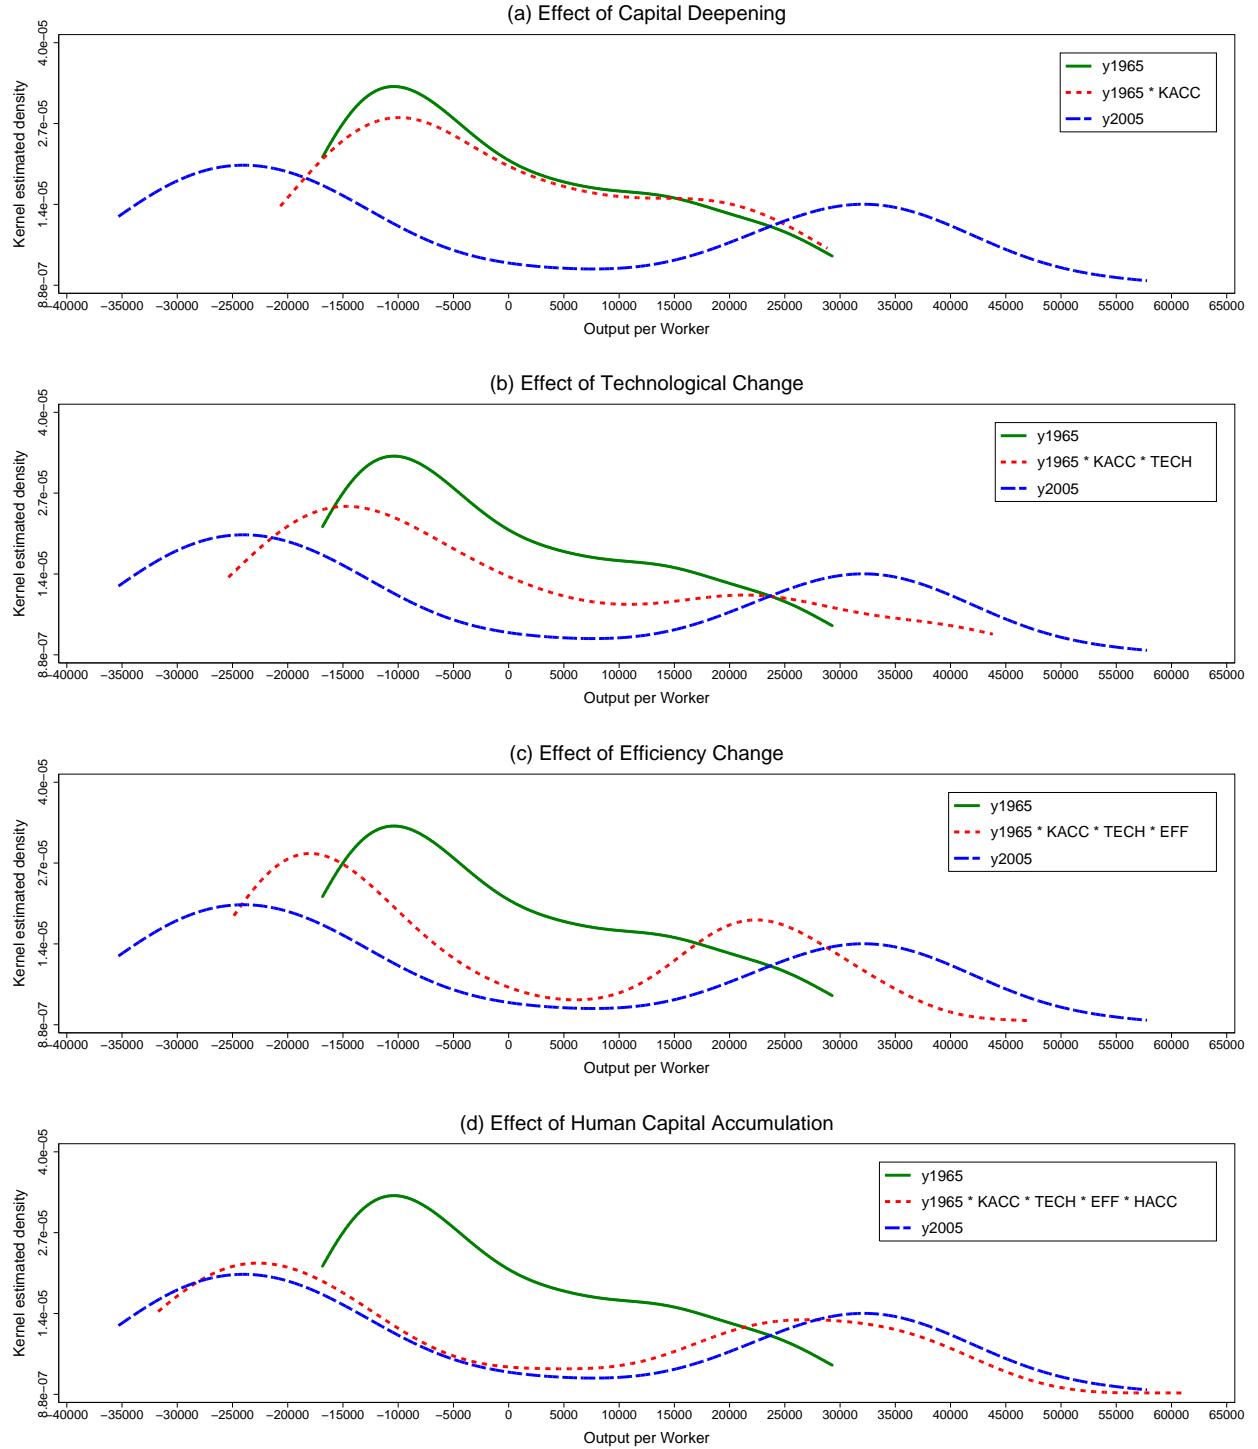

Figure A.9: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: KACC, TECH, EFF, and HACC

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of capital deepening, technological change, efficiency change, and human capital accumulation on the 1965 distribution.

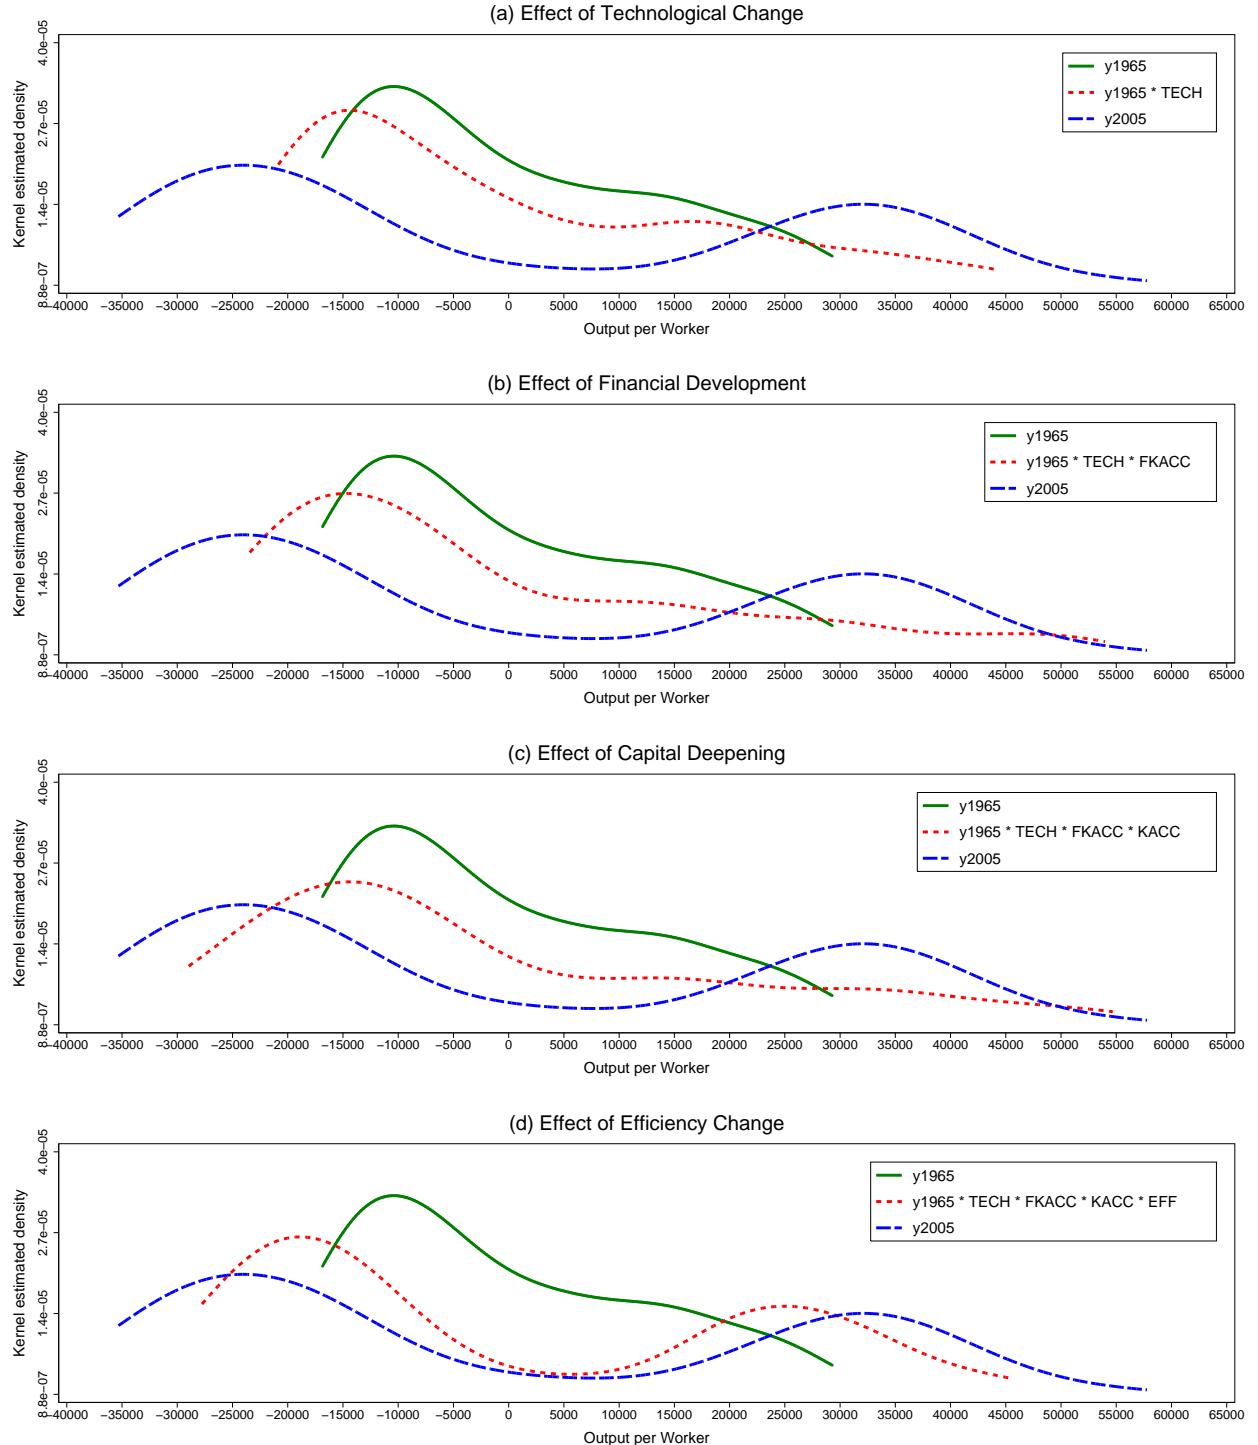

Figure A.10: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: TECH, FKACC, KACC and EFF

Notes: In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of technological change, financial development, capital deepening, and efficiency change on the 1965 distribution.

## Appendix C.2 Private Credit by Deposit Money Banks/GDP (CREDIT2, cut-off 25/75%)

Table A.9: Linking financial efficiency and financial development<sup>a</sup>

<sup>a</sup> The dependent variable is the log of the inverse of the financial efficiency measure. The coefficients on the financial development regimes (regions) represent the sum of coefficients and the respective numbers below the coefficients are p-values for the sum of coefficients

<sup>b</sup> Financial development falls into the low region if its value is lower than the 25<sup>th</sup> percentile of the financial development distribution

<sup>c</sup> Financial development falls into the middle region if its value is between the 25<sup>th</sup> and 75<sup>th</sup> percentiles (inclusive) of the financial development distribution

<sup>d</sup> Financial development falls into the high region if its value is greater than the 75<sup>th</sup> percentile of the financial development distribution

<sup>e</sup> p-value of the F-statistic on the three coefficients on financial development in the main regression.

Table A.10: Financial efficiency augmentation factors

| #  | Country        | 1965  | 2005  | #  | Country              | 1965  | 2005  |

Figure A.11: Distributions of financial development index, 1965 and 2005

*Notes:* Estimated 1965 and 2005 distributions of financial development index. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 2005 distribution and the dashed vertical line represents the 2005 mean value.

Table A.11: Efficiency indices

| #  | Country        | Without Financial Development |      | With Financial Development |      |
|----|----------------|-------------------------------|------|----------------------------|------|

Figure A.12: Distributions of efficiency index, 1965 and 2005

*Notes:* Estimated 1965 and 2005 distributions of efficiency index. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 2005 distribution and the dashed vertical line represents the 2005 mean value.

*Notes:* The bold italic abbreviations show the 1965 observations and the normal font abbreviations show the 2005 observations. The dotted line represents the 1965 production frontier and the solid line presents the 2005 production frontier.

\* OECD countries as of 1990.

\*\* Japan, Malaysia, Singapore, and Thailand.

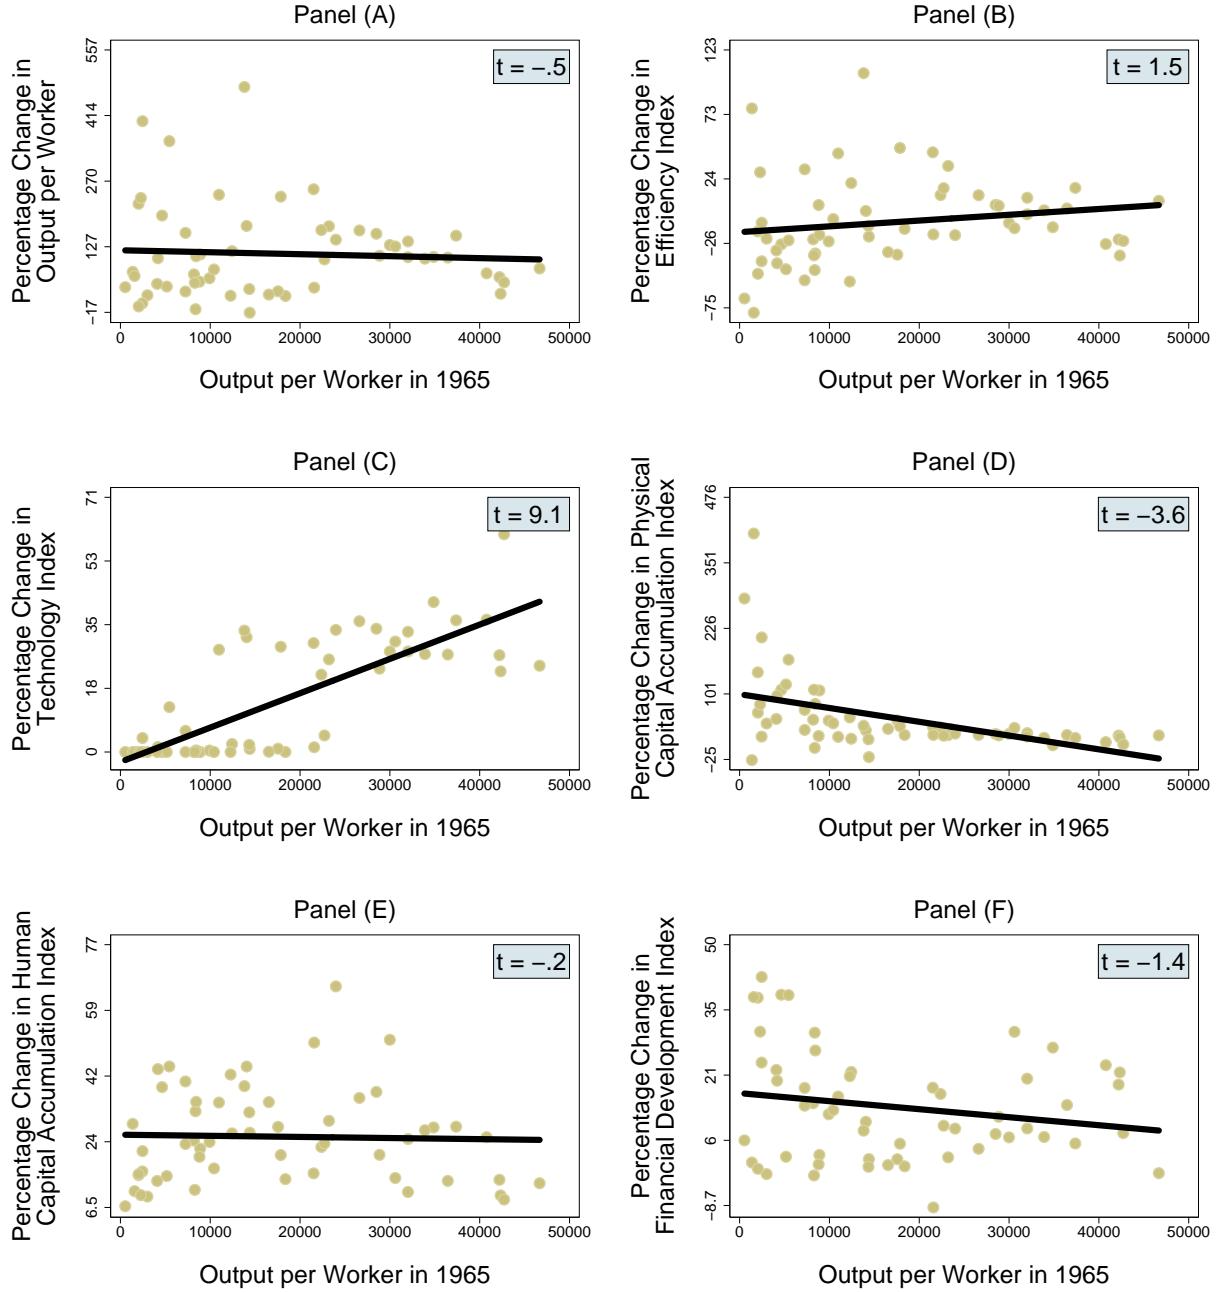

Figure A.14: Percentage change (from 1965 to 2005) in output per worker and five decomposition indices, plotted against output per worker in 1965.

Notes: Each panel contains a GLS regression line; the top right number in each panel is a  $t$ -statistic of a respective GLS regression based on "heteroskedasticity-consistent" estimators for the variance (Huber (1981); White (1980)).

| 29 | $g(y_{2005})$ vs. $f(y_{1965} \times EFF \times TECH \times HACC \times FKACC)$          | 0.0088                       |
| 30 | $g(y_{2005})$ vs. $f(y_{1965} \times EFF \times KACC \times HACC \times FKACC)$          | 0.0034                       |
| 31 | $g(y_{2005})$ vs. $f(y_{1965} \times TECH \times KACC \times HACC \times FKACC)$         | 0.0800                       |

Notes: We used the bootstrapped Li (1996) test with 5000 bootstrap replications and the Sheather and Jones (1991) bandwidth.

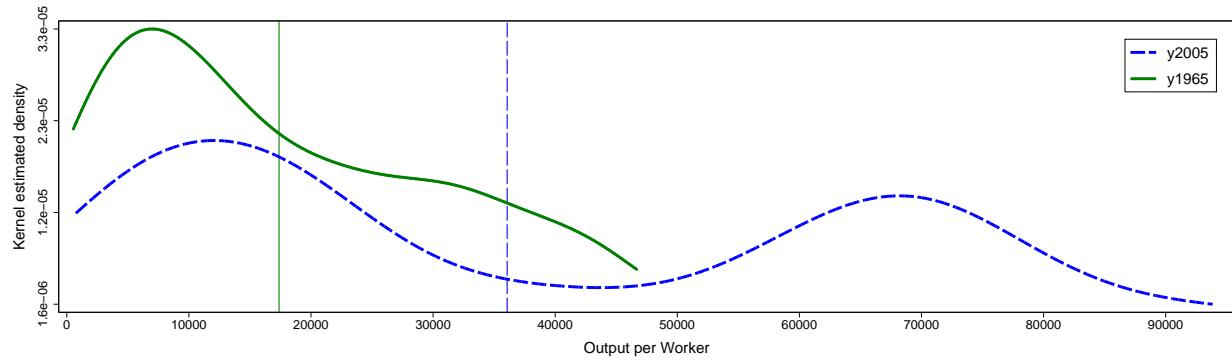

Figure A.15: Distributions of output per worker, 1965 and 2005

*Notes:* Estimated 1965 and 2005 distributions of output per worker. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 2005 distribution and the dashed vertical line represents the 2005 mean value.

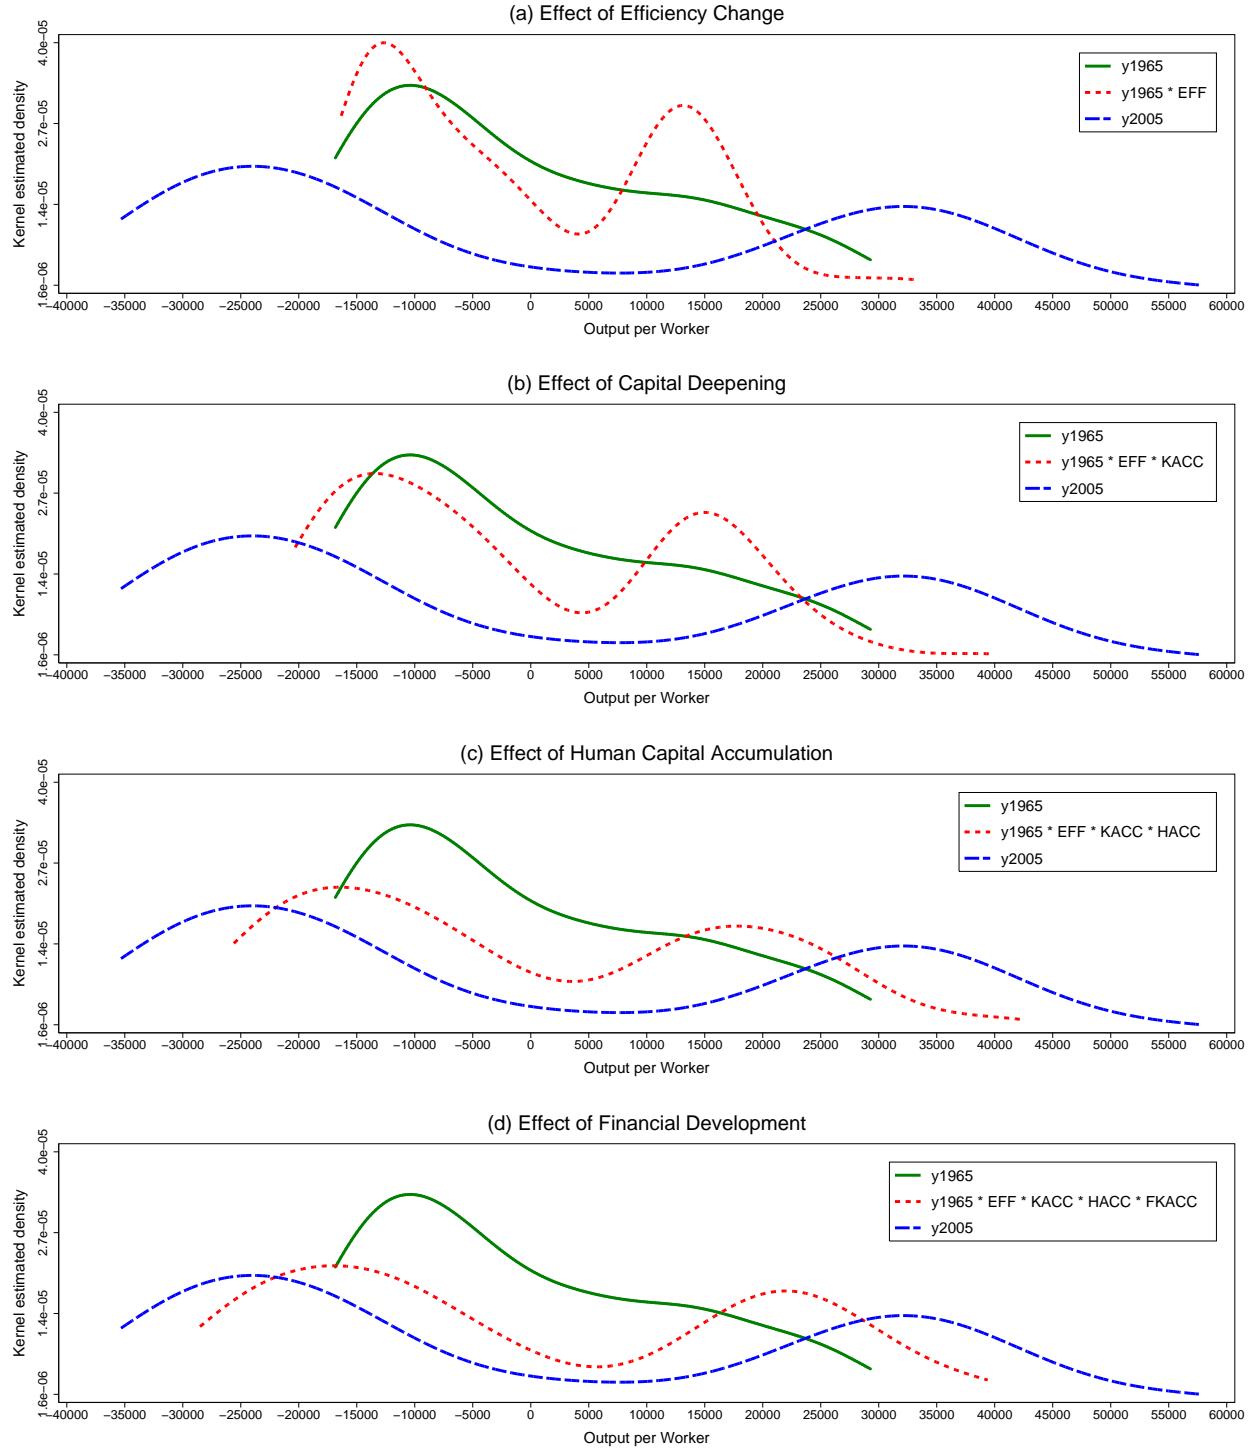

Figure A.16: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: EFF, KACC HACC, and FKACC

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of efficiency change, capital deepening, human capital accumulation, and financial development on the 1965 distribution.

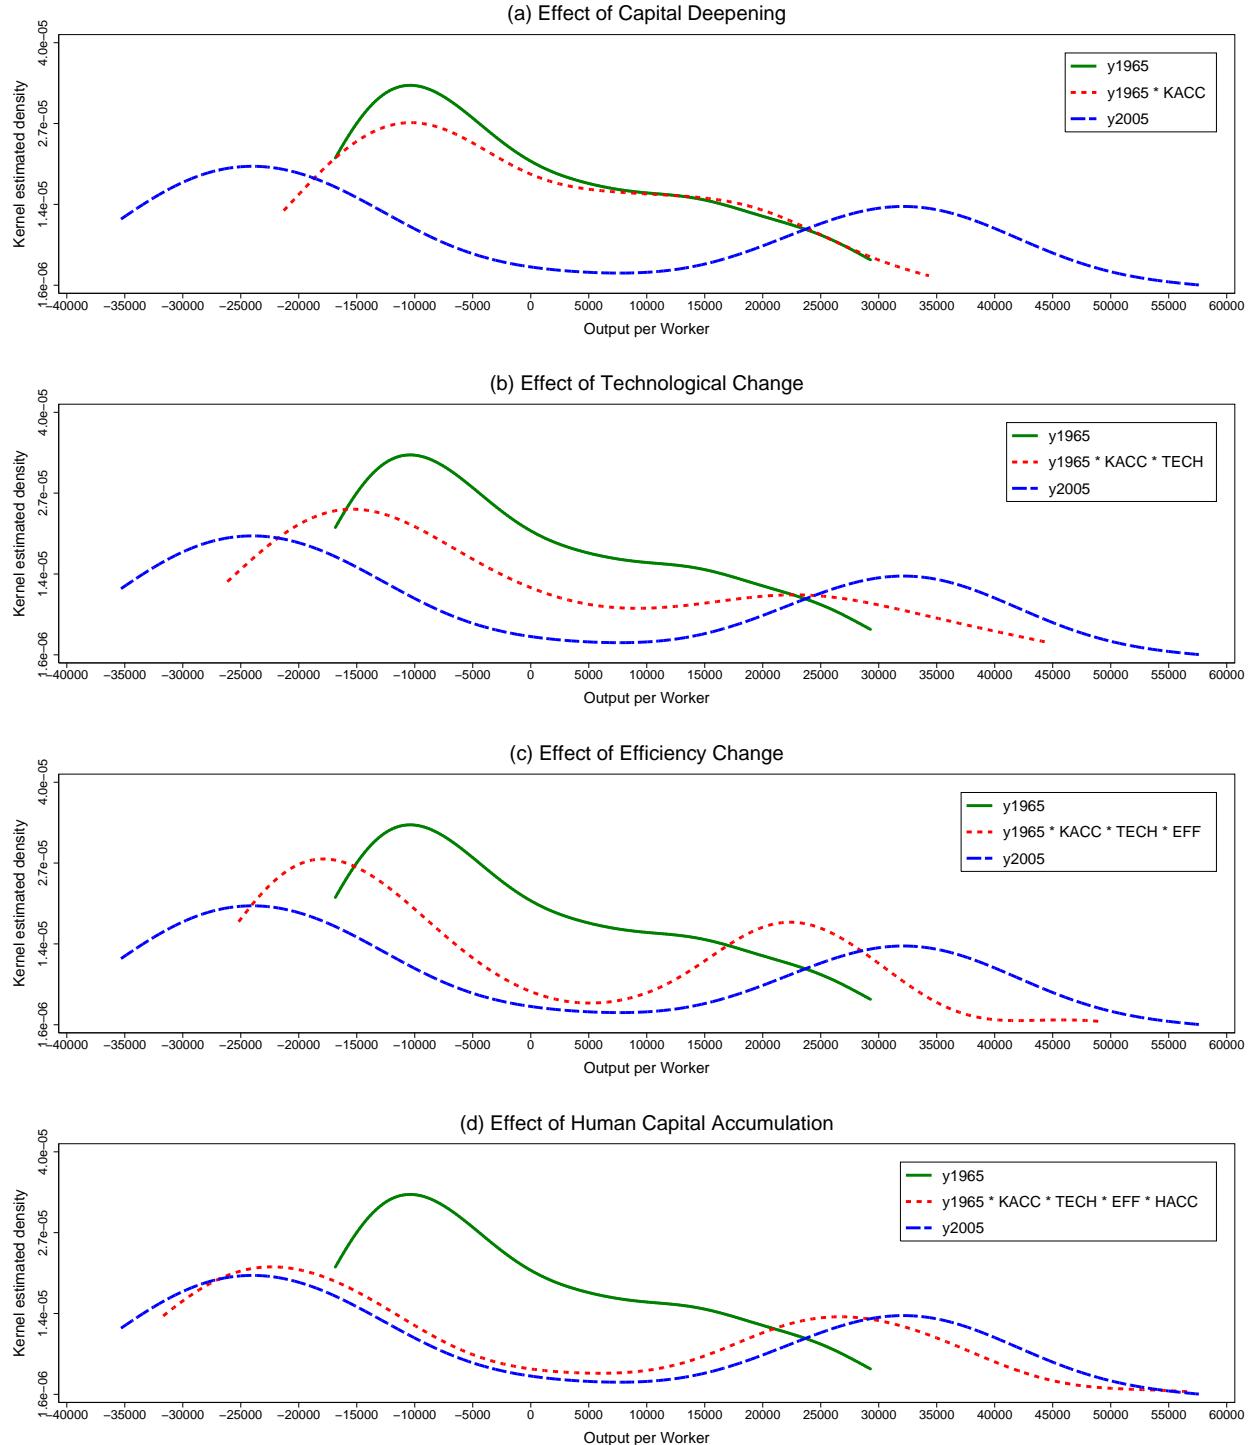

Figure A.17: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: KACC, TECH, EFF, and HACC

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of capital deepening, technological change, efficiency change, and human capital accumulation on the 1965 distribution.

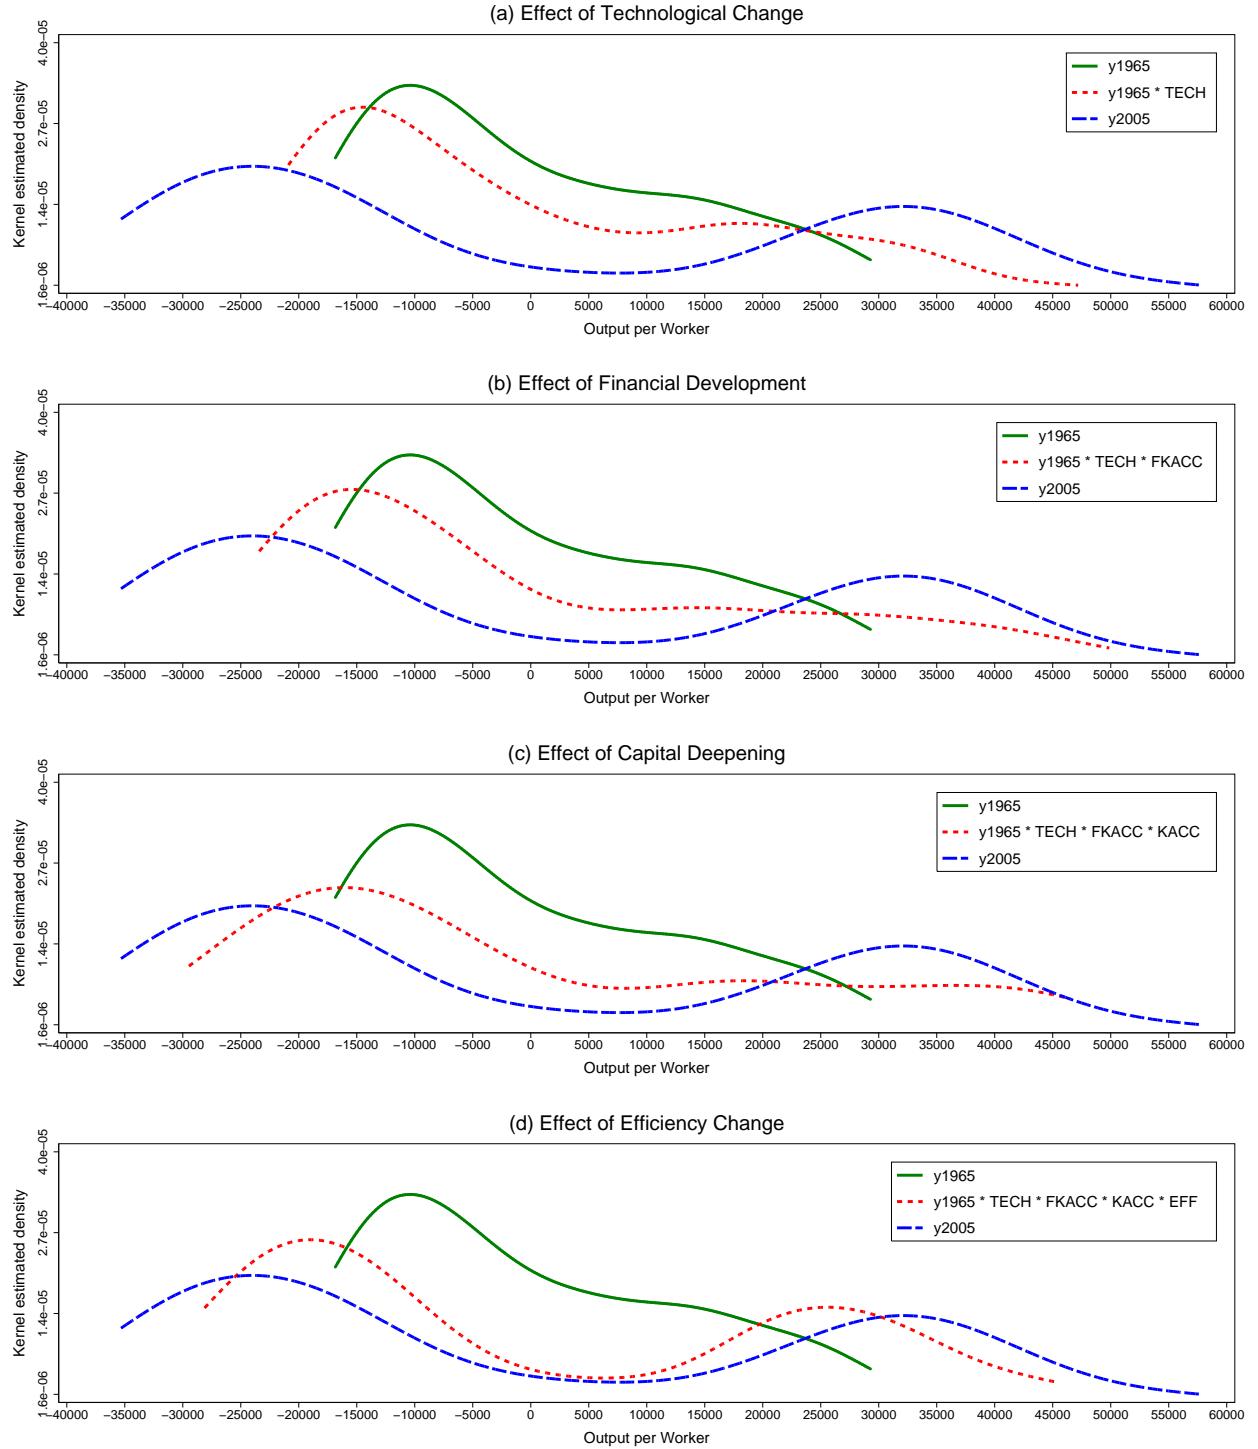

Figure A.18: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: TECH, FKACC, KACC and EFF

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of technological change, financial development, capital deepening, and efficiency change on the 1965 distribution.

### Appendix C.3 Liquid Liabilities/GDP (LLY, cut-off 25/75%)

Table A.16: Linking financial efficiency and financial development<sup>a</sup>

|                                 | Net interest margin |                  |                  | Overhead costs   |                   |                   |

<sup>a</sup> The dependent variable is the log of the inverse of the financial efficiency measure. The coefficients on the financial development regimes (regions) represent the sum of coefficients and the respective numbers below the coefficients are p-values for the sum of coefficients

<sup>b</sup> Financial development falls into the low region if its value is lower than the 25<sup>th</sup> percentile of the financial development distribution

<sup>c</sup> Financial development falls into the middle region if its value is between the 25<sup>th</sup> and 75<sup>th</sup> percentiles (inclusive) of the financial development distribution

<sup>d</sup> Financial development falls into the high region if its value is greater than the 25<sup>th</sup> percentile of the financial development distribution

<sup>e</sup> p-value of the F-statistic on the three coefficients on financial development in the main regression.

Figure A.20: Distributions of efficiency index, 1965 and 2005

*Notes:* Estimated 1965 and 2005 distributions of efficiency index. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 2005 distribution and the dashed vertical line represents the 2005 mean value.

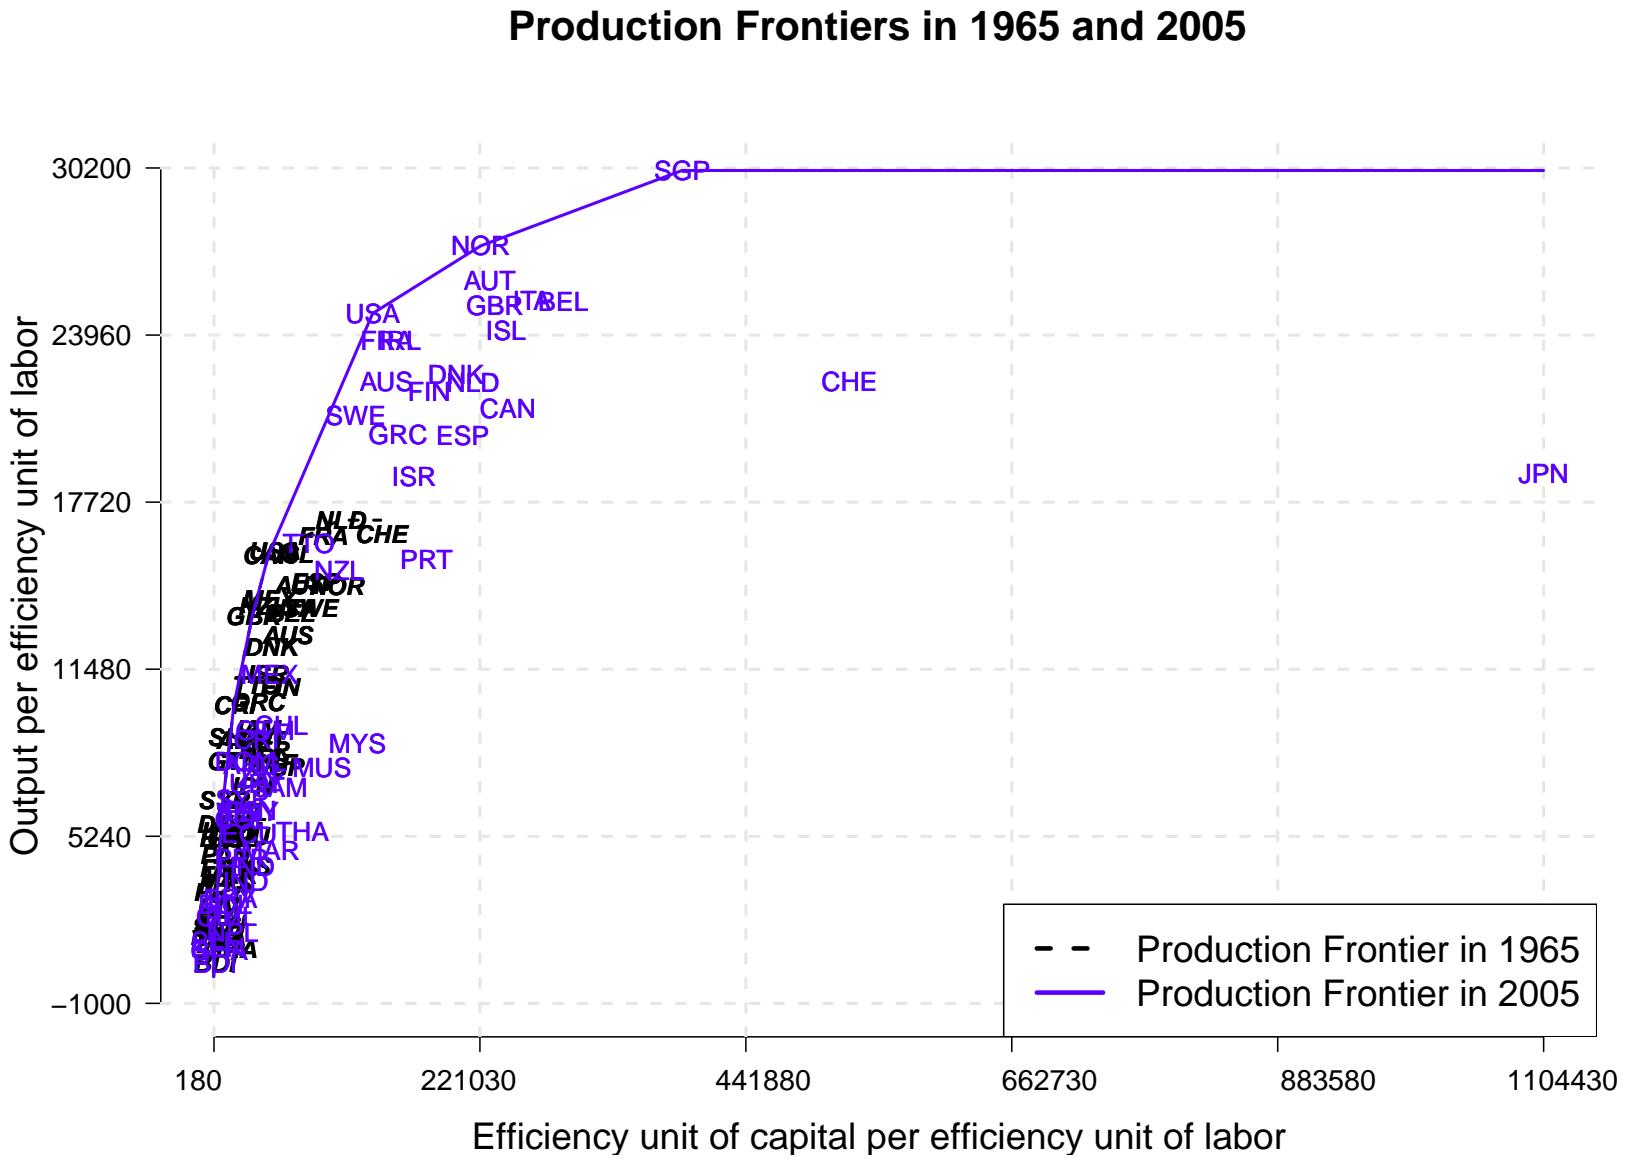

Figure A.21: Production frontiers in 1965 and 2005

*Notes:* The bold italic abbreviations show the 1965 observations and the normal font abbreviations show the 2005 observations. The dotted line represents the 1965 production frontier and the solid line presents the 2005 production frontier.

\* OECD countries as of 1990.

\*\* Japan, Malaysia, Singapore, and Thailand.

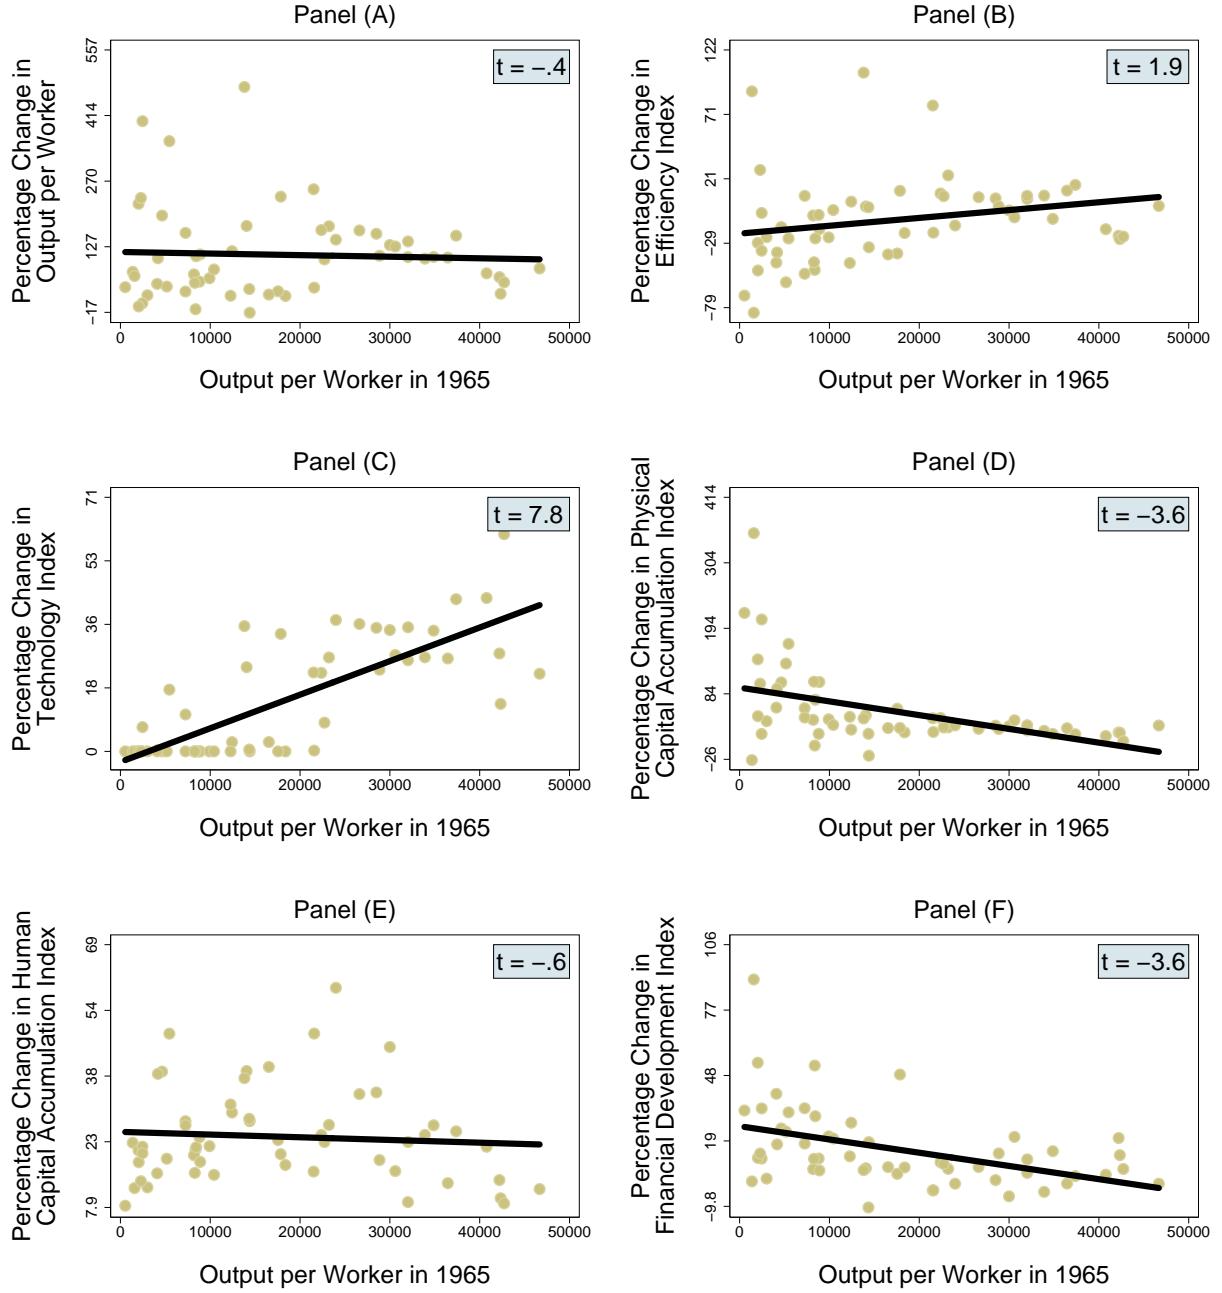

Figure A.22: Percentage change (from 1965 to 2005) in output per worker and five decomposition indices, plotted against output per worker in 1965.

Notes: Each panel contains a GLS regression line; the top right number in each panel is a  $t$ -statistic of a respective GLS regression based on “heteroskedasticity-consistent” estimators for the variance (Huber (1981); White (1980)).

Table A.21: Modality tests (*p*-values)

Notes: We used the bootstrapped Li (1996) test with 5000 bootstrap replications and the Sheather and Jones (1991) bandwidth.

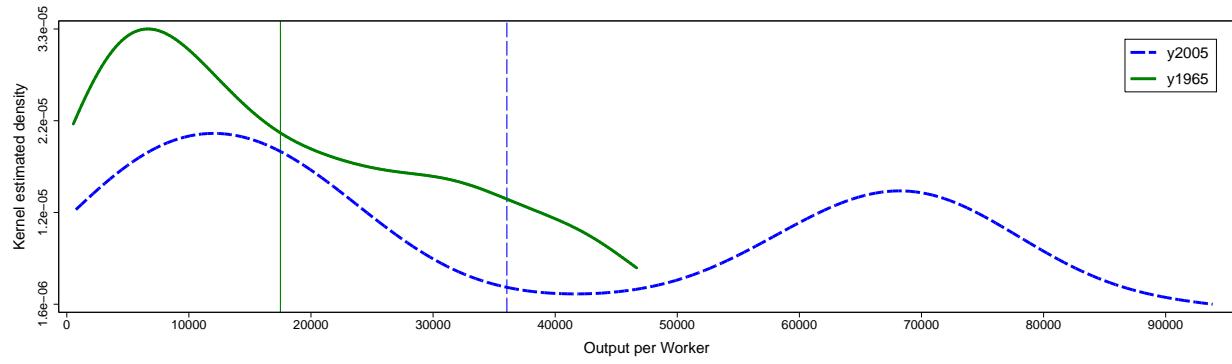

Figure A.23: Distributions of output per worker, 1965 and 2005

*Notes:* Estimated 1965 and 2005 distributions of output per worker. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 2005 distribution and the dashed vertical line represents the 2005 mean value.

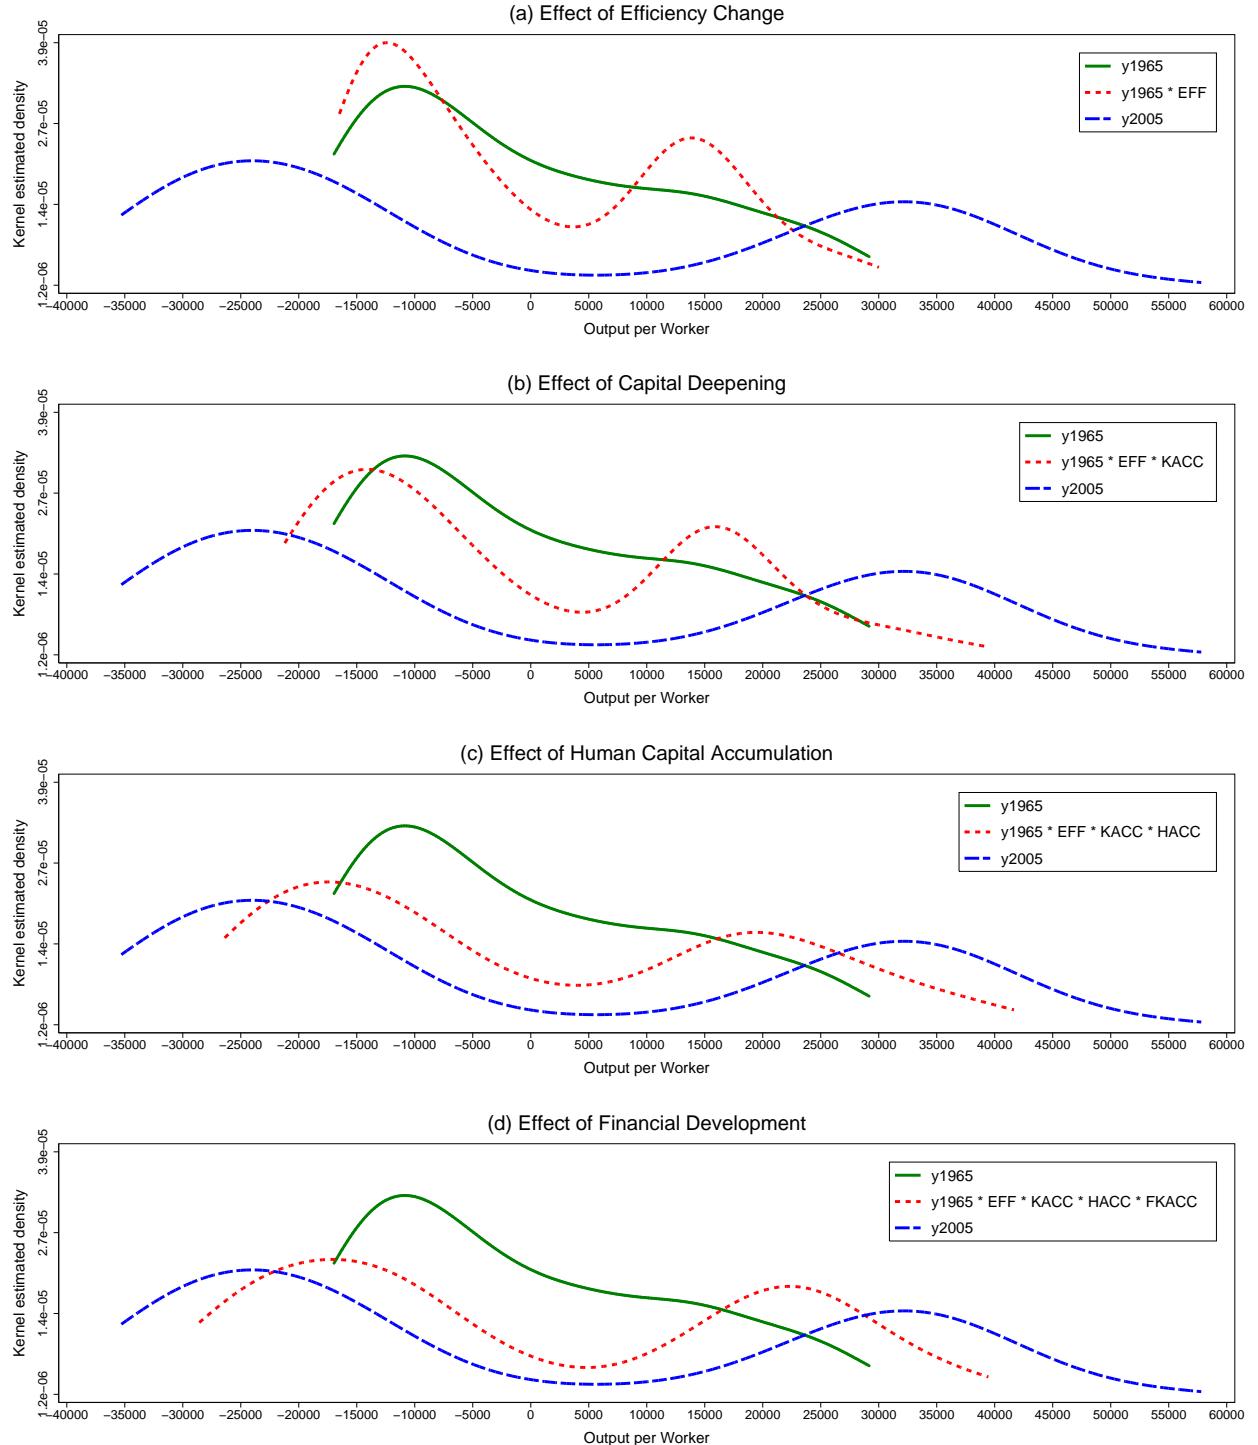

Figure A.24: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: EFF, KACC HACC, and FKACC

Notes: In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of efficiency change, capital deepening, human capital accumulation, and financial development on the 1965 distribution.

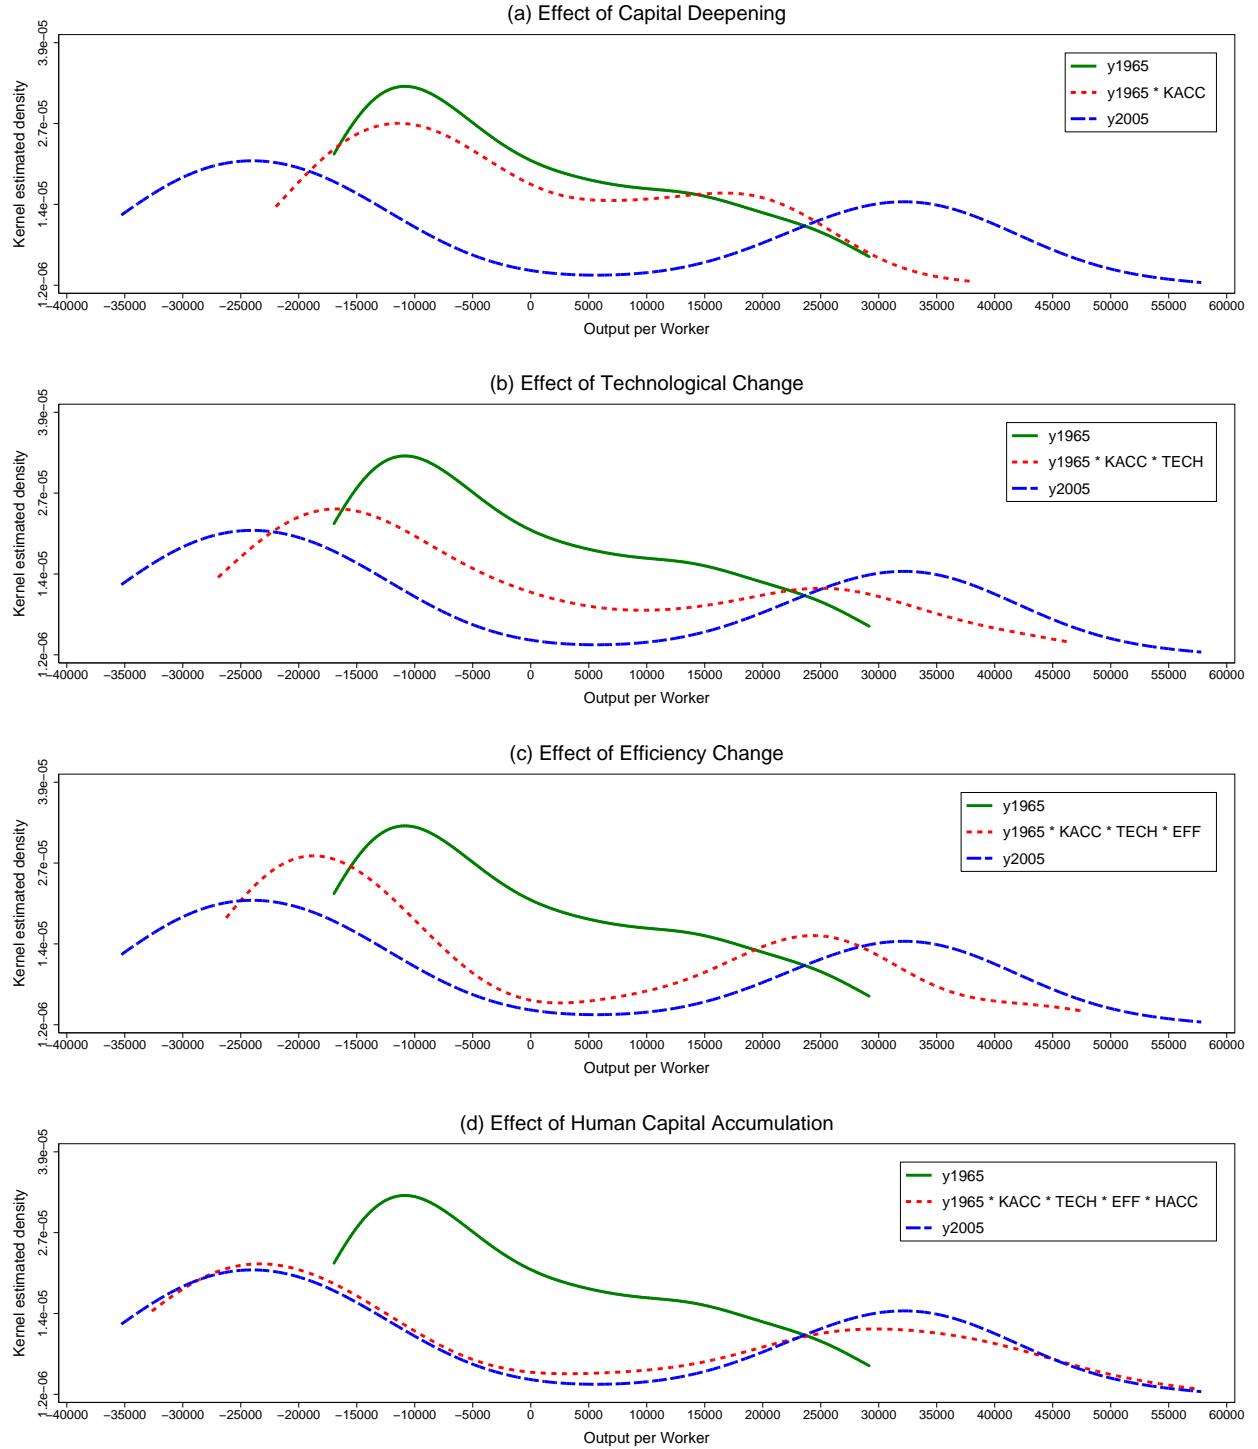

Figure A.25: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: KACC, TECH, EFF, and HACC

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of capital deepening, technological change, efficiency change, and human capital accumulation on the 1965 distribution.

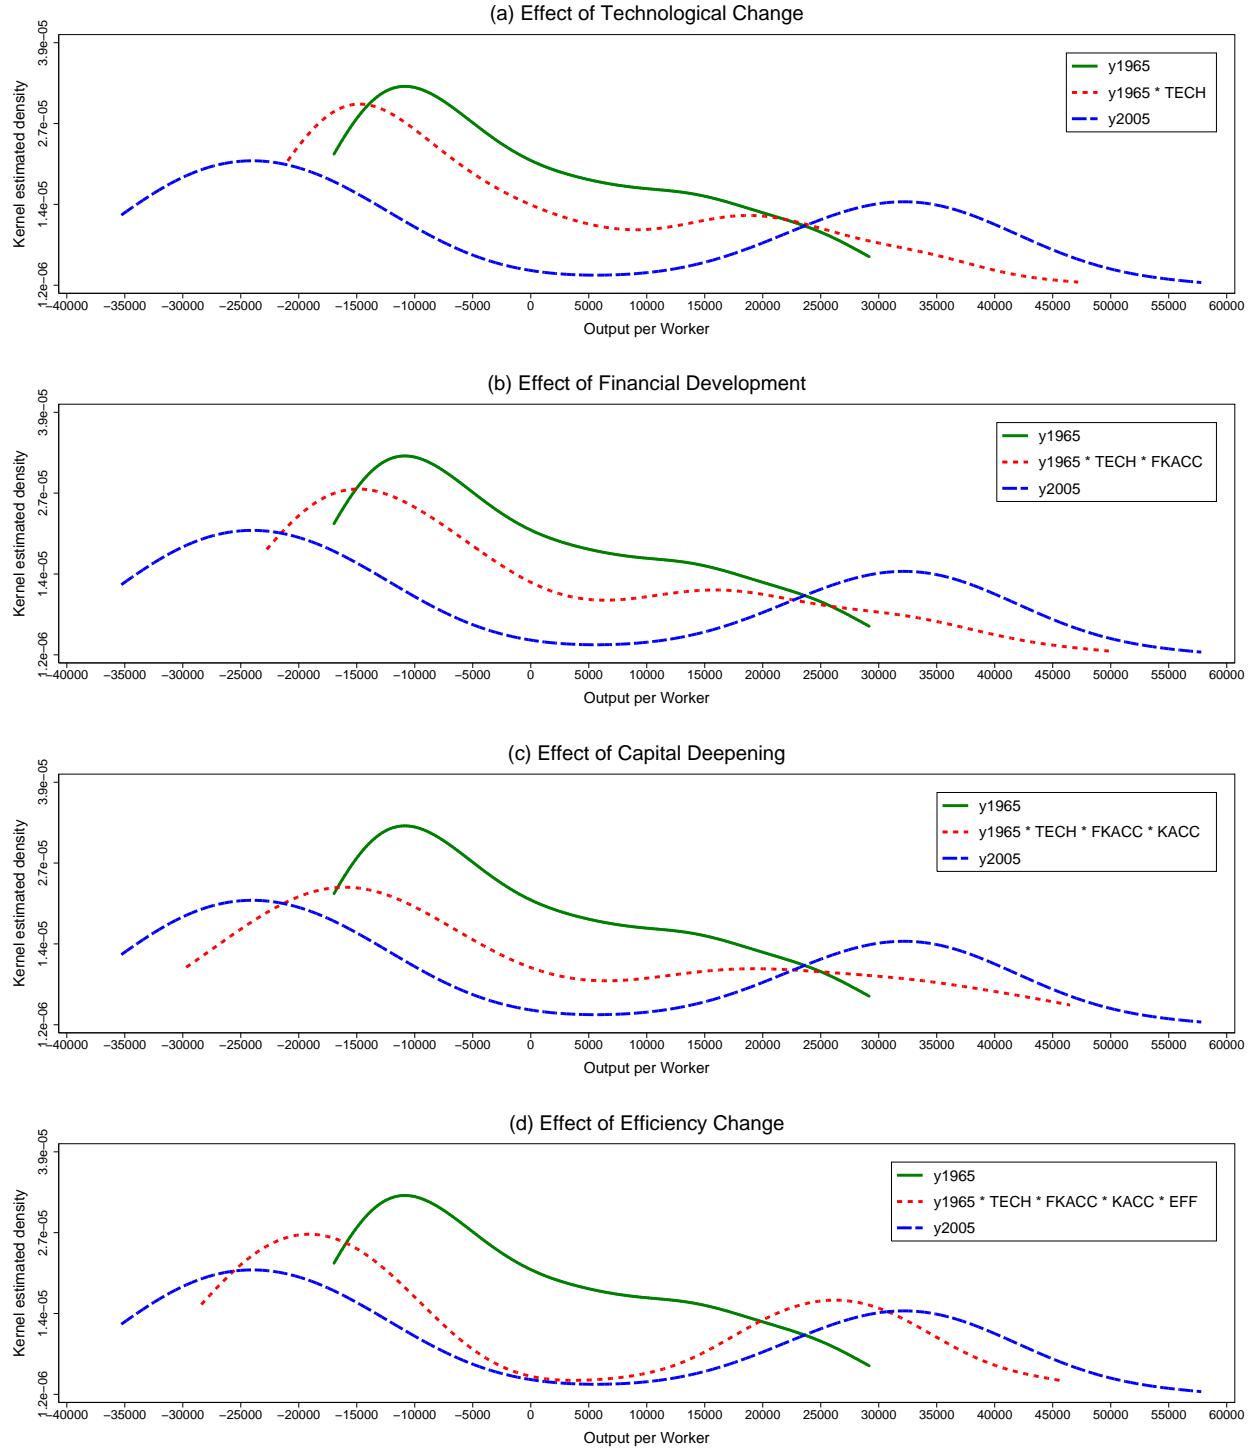

Figure A.26: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: TECH, FKACC, KACC and EFF

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of technological change, financial development, capital deepening, and efficiency change on the 1965 distribution.

## Appendix C.4 Claims on the Non-financial Private Sector/ GDP (PRIVY, cut-off 25/75%)

<sup>a</sup> The dependent variable is the log of the inverse of the financial efficiency measure. The coefficients on the financial development regimes (regions) represent the sum of coefficients and the respective numbers below the coefficients are p-values for the sum of coefficients

<sup>b</sup> Financial development falls into the low region if its value is lower than the 25<sup>th</sup> percentile of the financial development distribution

<sup>c</sup> Financial development falls into the middle region if its value is between the 25<sup>th</sup> and 75<sup>th</sup> percentiles (inclusive) of the financial development distribution

<sup>d</sup> Financial development falls into the high region if its value is greater than the 75<sup>th</sup> percentile of the financial development distribution

<sup>e</sup> p-value of the F-statistic on the three coefficients on financial development in the main regression.

Table A.24: Financial efficiency augmentation factors

Figure A.28: Distributions of efficiency index, 1965 and 2005

*Notes:* Estimated 1965 and 2005 distributions of efficiency index. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 2005 distribution and the dashed vertical line represents the 2005 mean value.

Figure A.29: Production frontiers in 1965 and 2005

Notes: The bold italic abbreviations show the 1965 observations and the normal font abbreviations show the 2005 observations. The dotted line represents the 1965 production frontier and the solid line presents the 2005 production frontier.

\* OECD countries as of 1990.

\*\* Japan, Malaysia, Singapore, and Thailand.

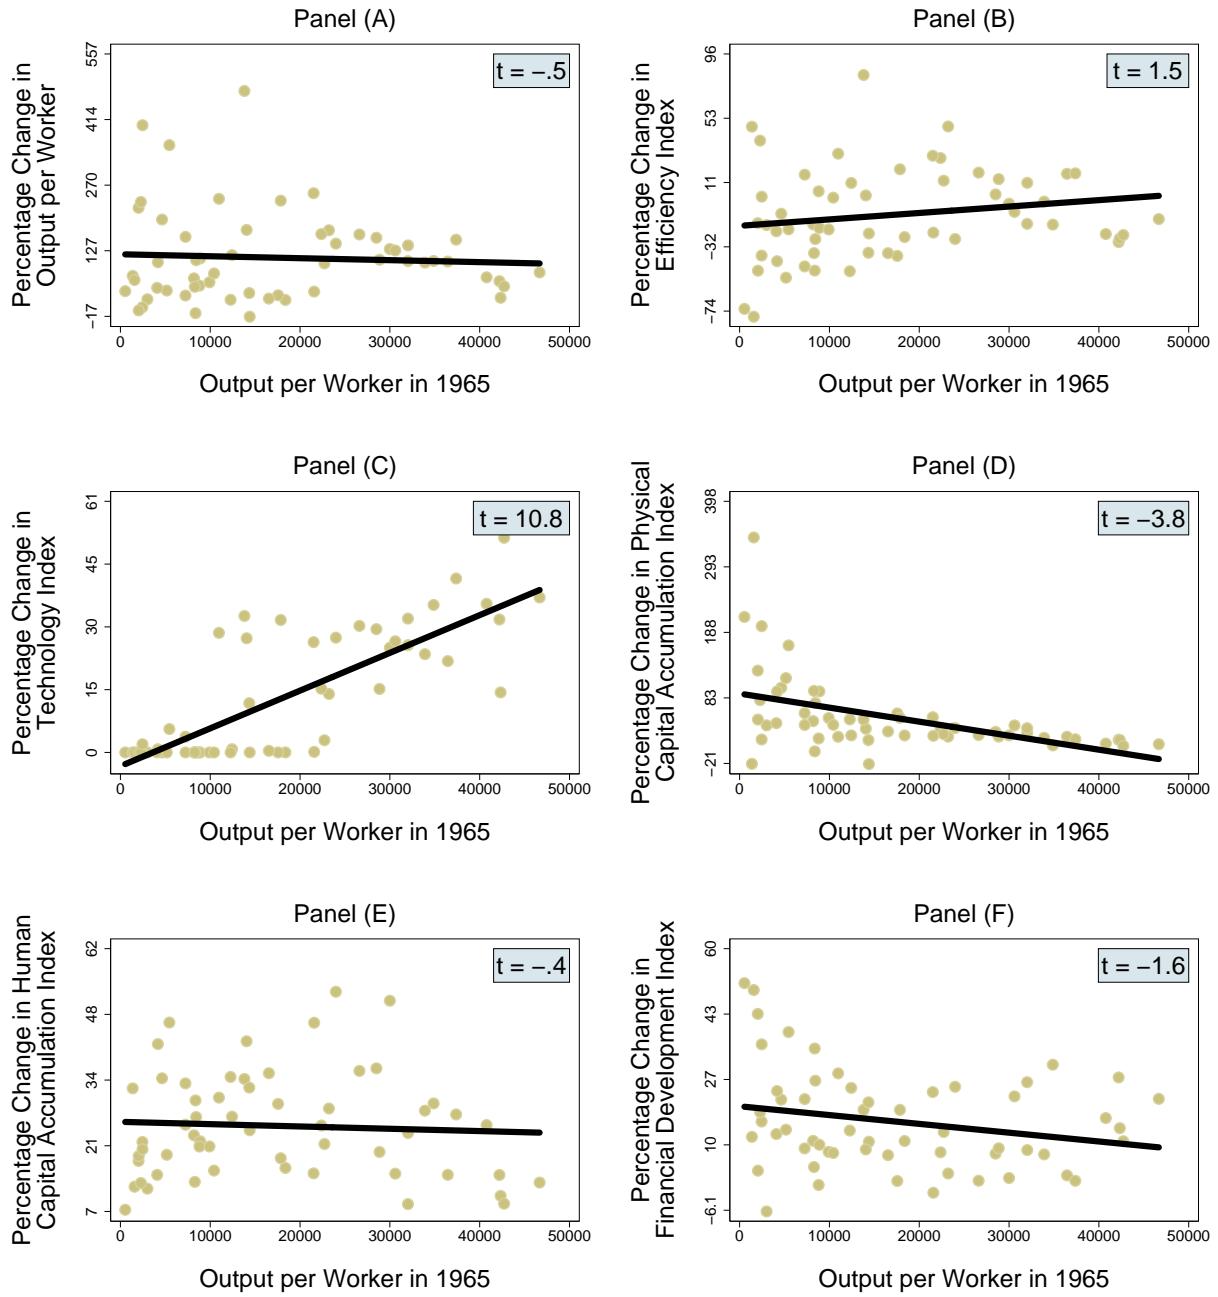

Figure A.30: Percentage change (from 1965 to 2005) in output per worker and five decomposition indices, plotted against output per worker in 1965.

*Notes:* Each panel contains a GLS regression line; the top right number in each panel is a  $t$ -statistic of a respective GLS regression based on “heteroskedasticity-consistent” estimators for the variance (Huber (1981); White (1980)).

Table A.28: Modality tests (*p*-values)

Notes: We used the bootstrapped Li (1996) test with 5000 bootstrap replications and the Sheather and Jones (1991) bandwidth.

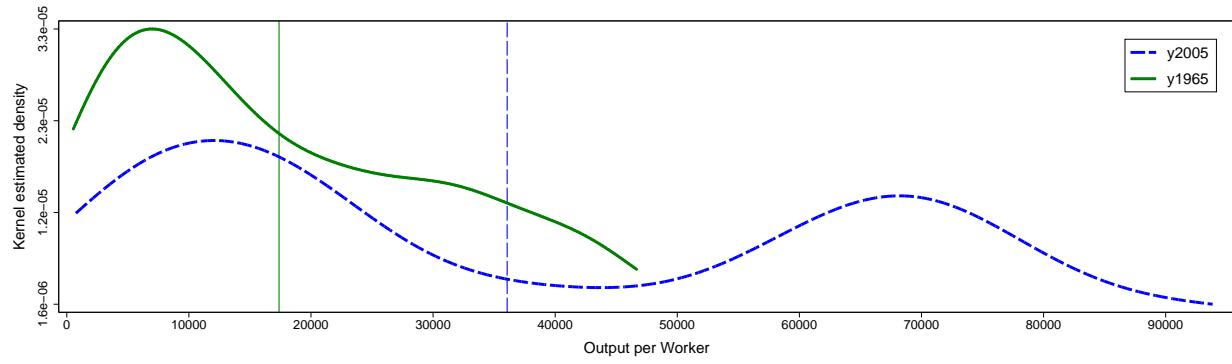

Figure A.31: Distributions of output per worker, 1965 and 2005

*Notes:* Estimated 1965 and 2005 distributions of output per worker. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 2005 distribution and the dashed vertical line represents the 2005 mean value.

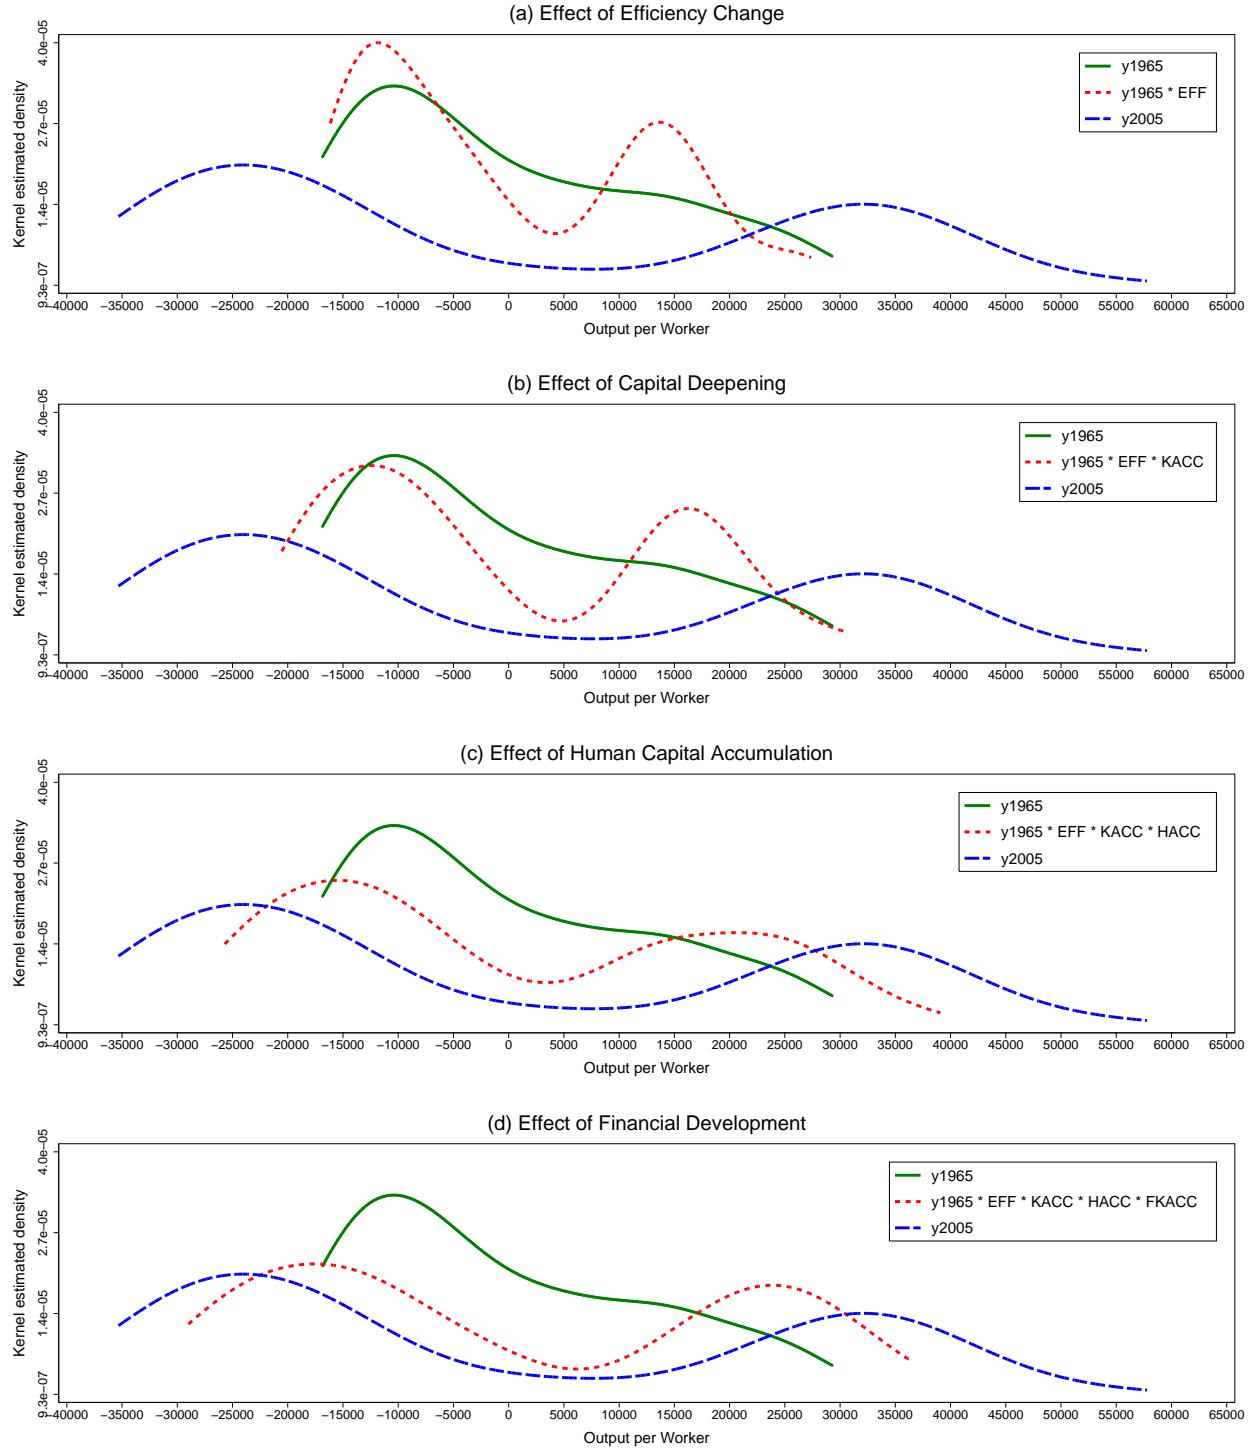

Figure A.32: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: EFF, KACC HACC, and FKACC

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of efficiency change, capital deepening, human capital accumulation, and financial development on the 1965 distribution.

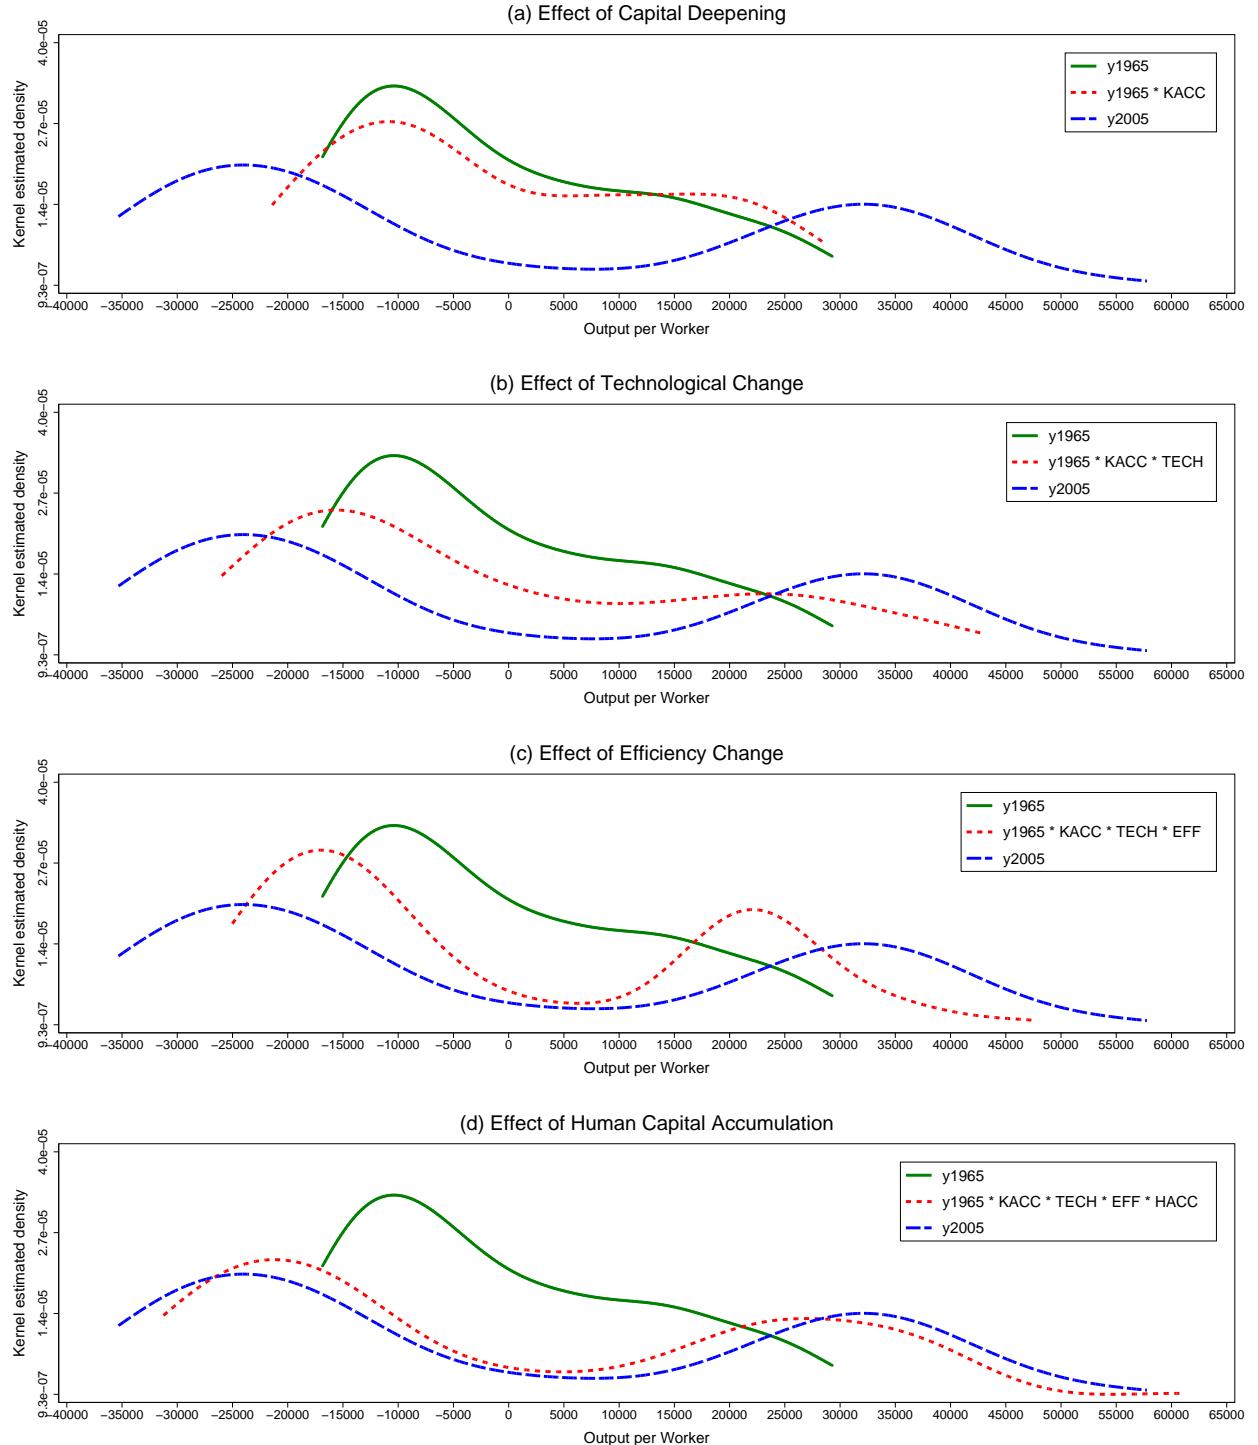

Figure A.33: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: KACC, TECH, EFF, and HACC

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of capital deepening, technological change, efficiency change, and human capital accumulation on the 1965 distribution.

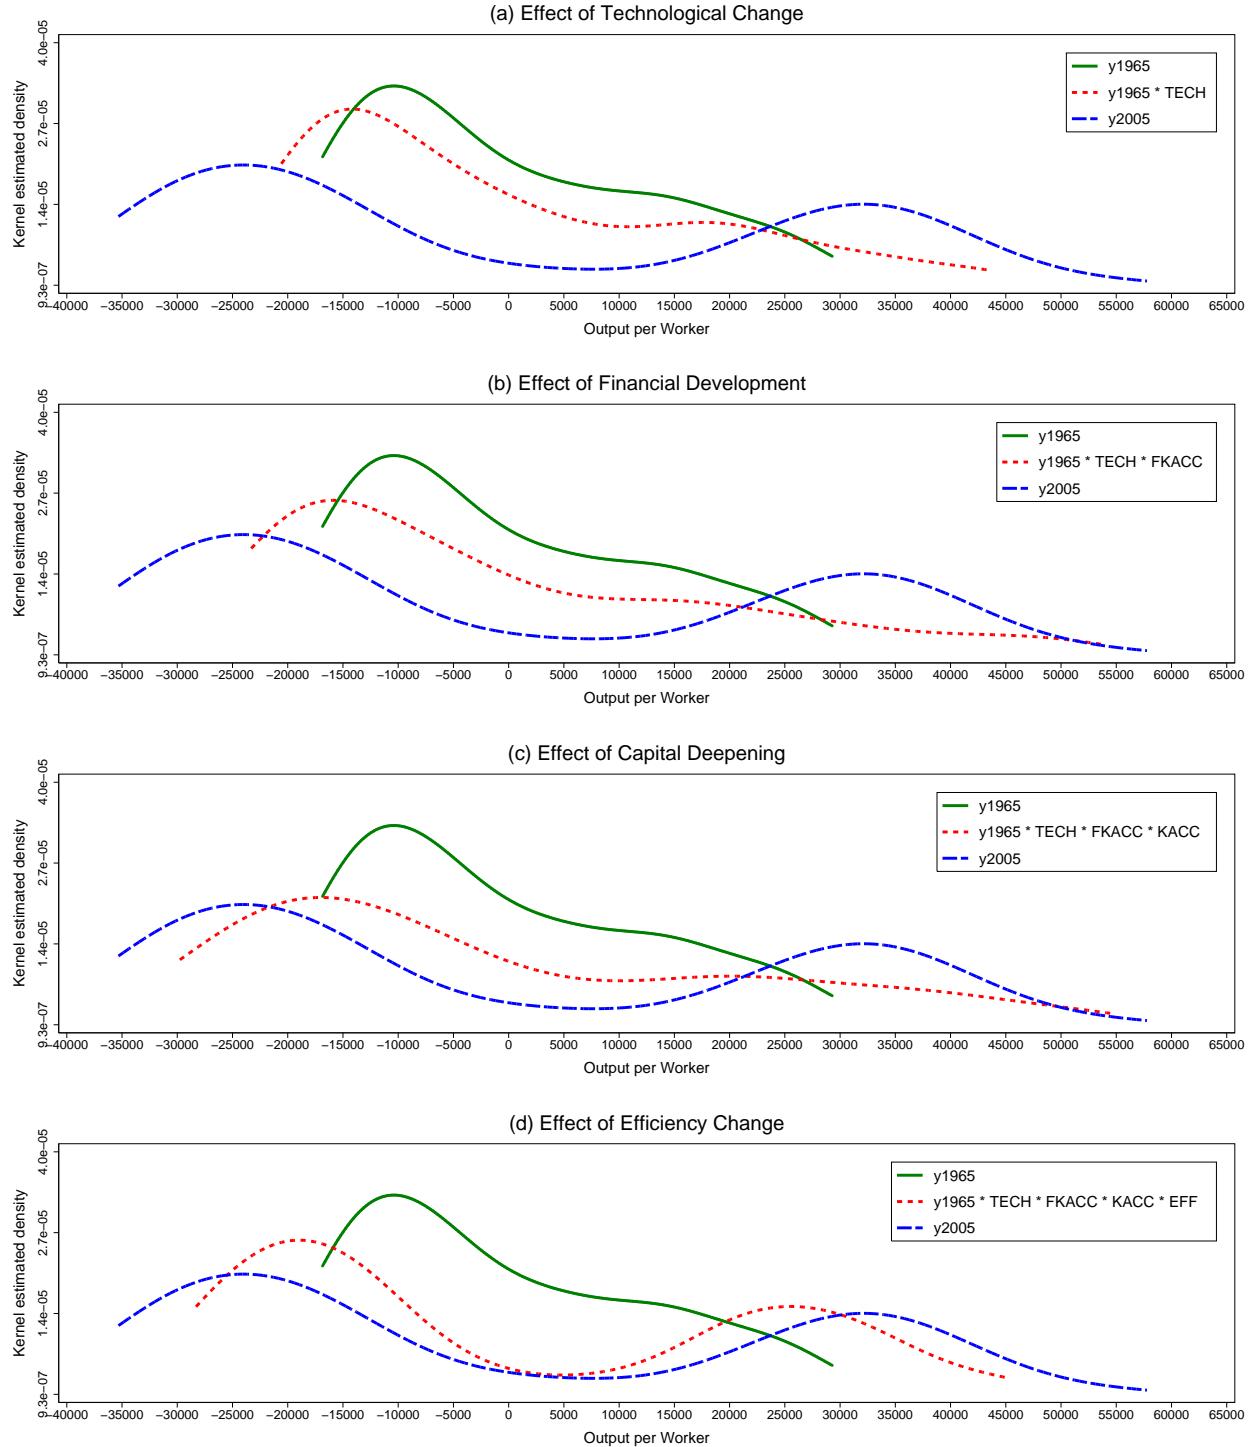

Figure A.34: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: TECH, FKACC, KACC and EFF

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of technological change, financial development<sup>78</sup>, capital deepening, and efficiency change on the 1965 distribution.

## Appendix C.5 Private Credit by Deposit Money Banks and other Financial Institutions /GDP (CREDIT1, cut-off 30/70%)

Table A.30: Linking financial efficiency and financial development<sup>a</sup>

<sup>a</sup> The dependent variable is the log of the inverse of the financial efficiency measure. The coefficients on the financial development regimes (regions) represent the sum of coefficients and the respective numbers below the coefficients are p-values for the sum of coefficients

<sup>b</sup> Financial development falls into the low region if its value is lower than the 30<sup>th</sup> percentile of the financial development distribution

<sup>c</sup> Financial development falls into the middle region if its value is between the 30<sup>th</sup> and 70<sup>th</sup> percentiles (inclusive) of the financial development distribution

<sup>d</sup> Financial development falls into the high region if its value is greater than the 70<sup>th</sup> percentile of the financial development distribution

<sup>e</sup> p-value of the F-statistic on the three coefficients on financial development in the main regression.

Table A.31: Financial efficiency augmentation factors

| #  | Country        | 1965  | 2005  | #  | Country              | 1965  | 2005  |

Figure A.36: Distributions of efficiency index, 1965 and 2005

*Notes:* Estimated 1965 and 2005 distributions of efficiency index. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 2005 distribution and the dashed vertical line represents the 2005 mean value.

*Notes:* The bold italic abbreviations show the 1965 observations and the normal font abbreviations show the 2005 observations. The dotted line represents the 1965 production frontier and the solid line presents the 2005 production frontier.

\* OECD countries as of 1990.

\*\* Japan, Malaysia, Singapore, and Thailand.

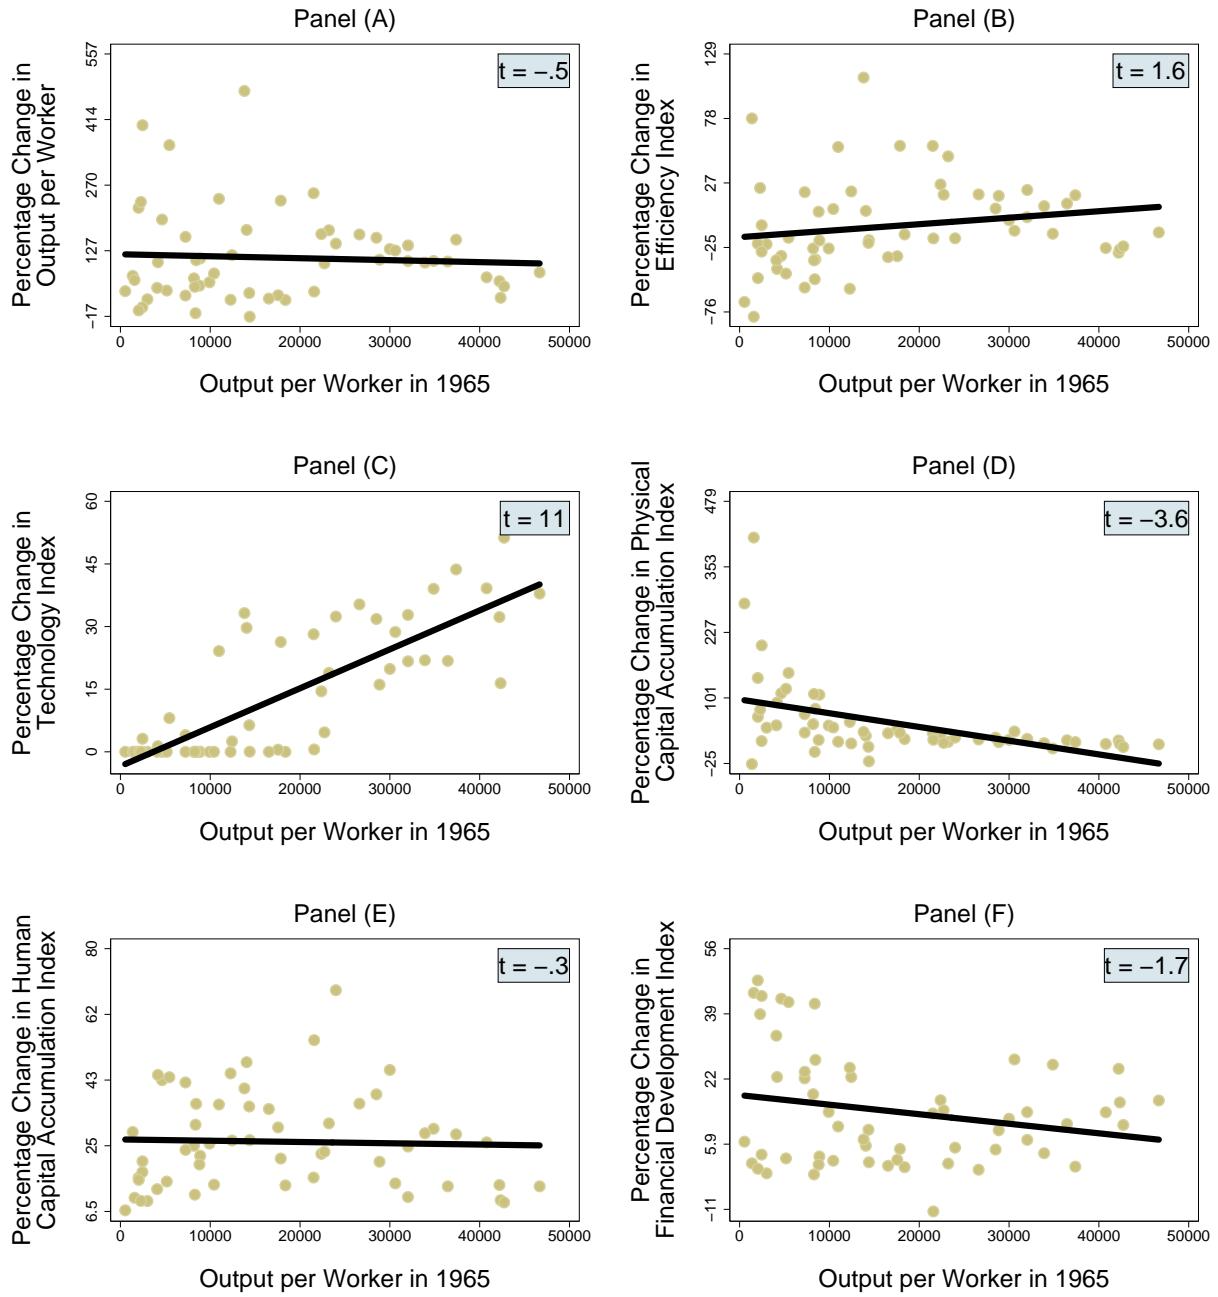

Figure A.38: Percentage change (from 1965 to 2005) in output per worker and five decomposition indices, plotted against output per worker in 1965.

Notes: Each panel contains a GLS regression line; the top right number in each panel is a  $t$ -statistic of a respective GLS regression based on “heteroskedasticity-consistent” estimators for the variance (Huber (1981); White (1980)).

Table A.35: Modality tests (*p*-values)

|    | $H_0$ : Distribution has one mode<br>$H_A$ : Distribution has more than one mode | Bootstrap<br><i>p</i> -value |

| 30 | $g(y_{2005})$ vs. $f(y_{1965} \times EFF \times KACC \times HACC \times FKACC)$          | 0.0036                       |
| 31 | $g(y_{2005})$ vs. $f(y_{1965} \times TECH \times KACC \times HACC \times FKACC)$         | 0.0692                       |

Notes: We used the bootstrapped Li (1996) test with 5000 bootstrap replications and the Sheather and Jones (1991) bandwidth.

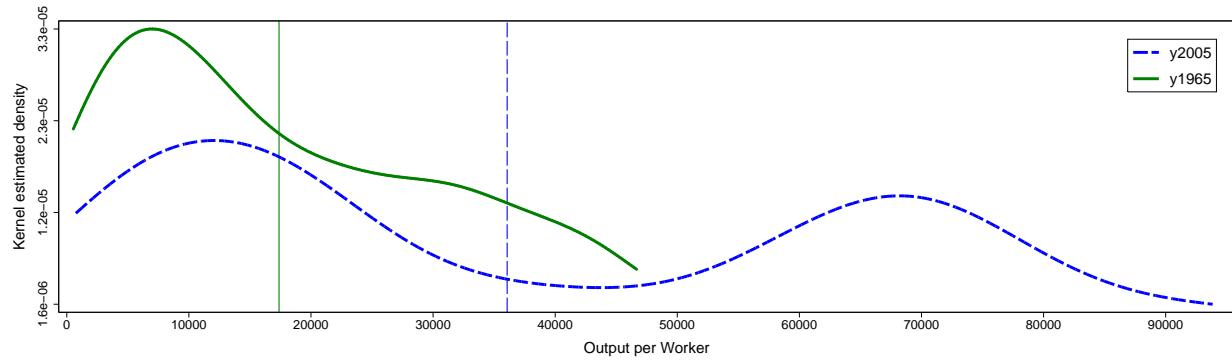

Figure A.39: Distributions of output per worker, 1965 and 2005

*Notes:* Estimated 1965 and 2005 distributions of output per worker. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 2005 distribution and the dashed vertical line represents the 2005 mean value.

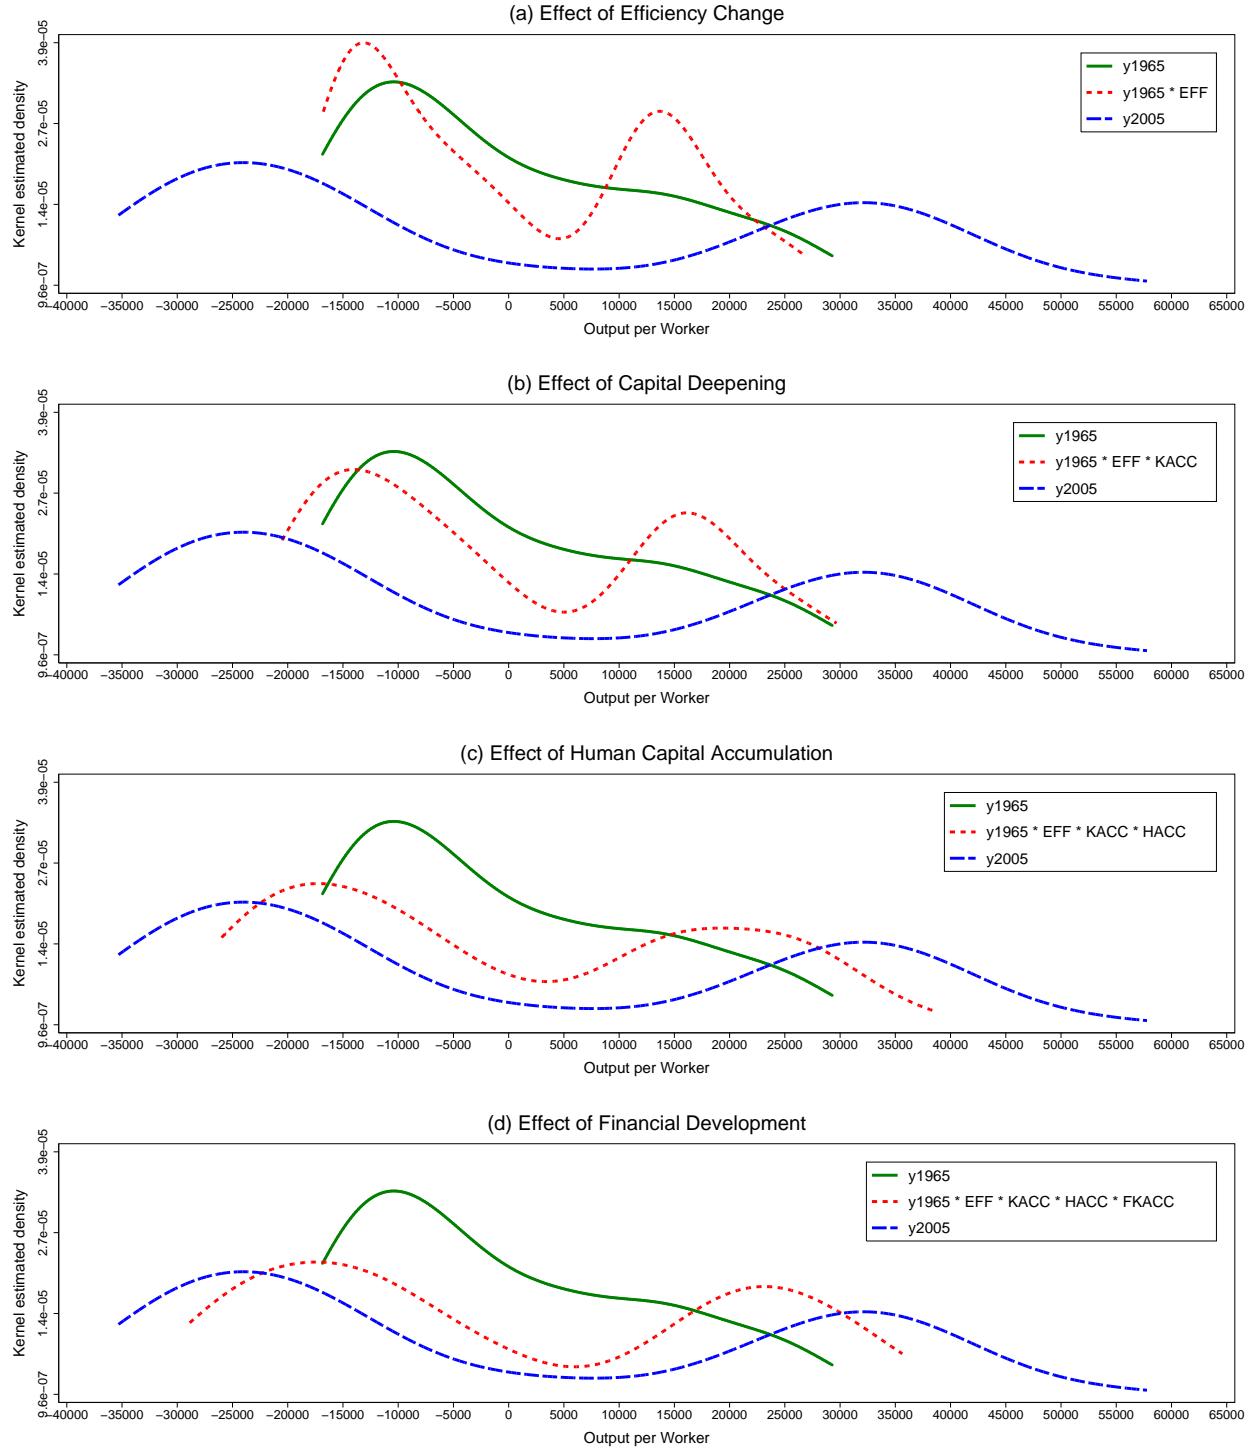

Figure A.40: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: EFF, KACC HACC, and FKACC

Notes: In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of efficiency change, capital deepening, human capital accumulation, and financial development on the 1965 distribution.

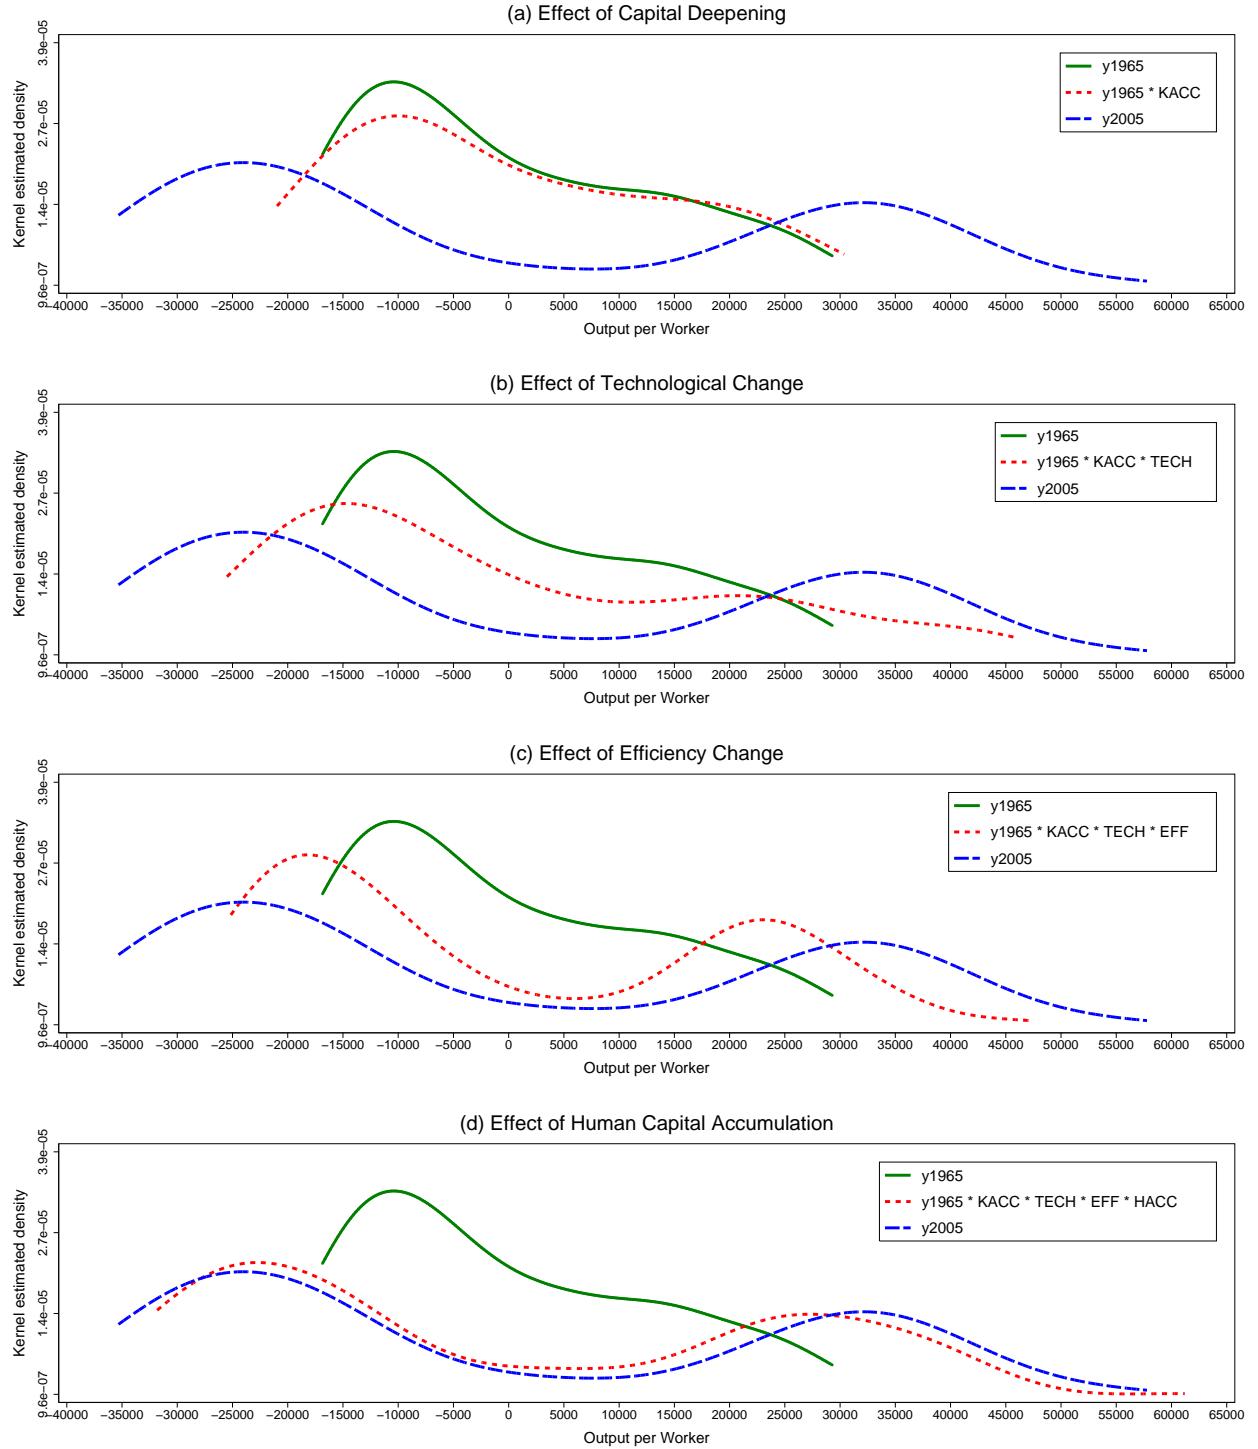

Figure A.41: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: KACC, TECH, EFF, and HACC

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of capital deepening, technological change, efficiency change, and human capital accumulation on the 1965 distribution.

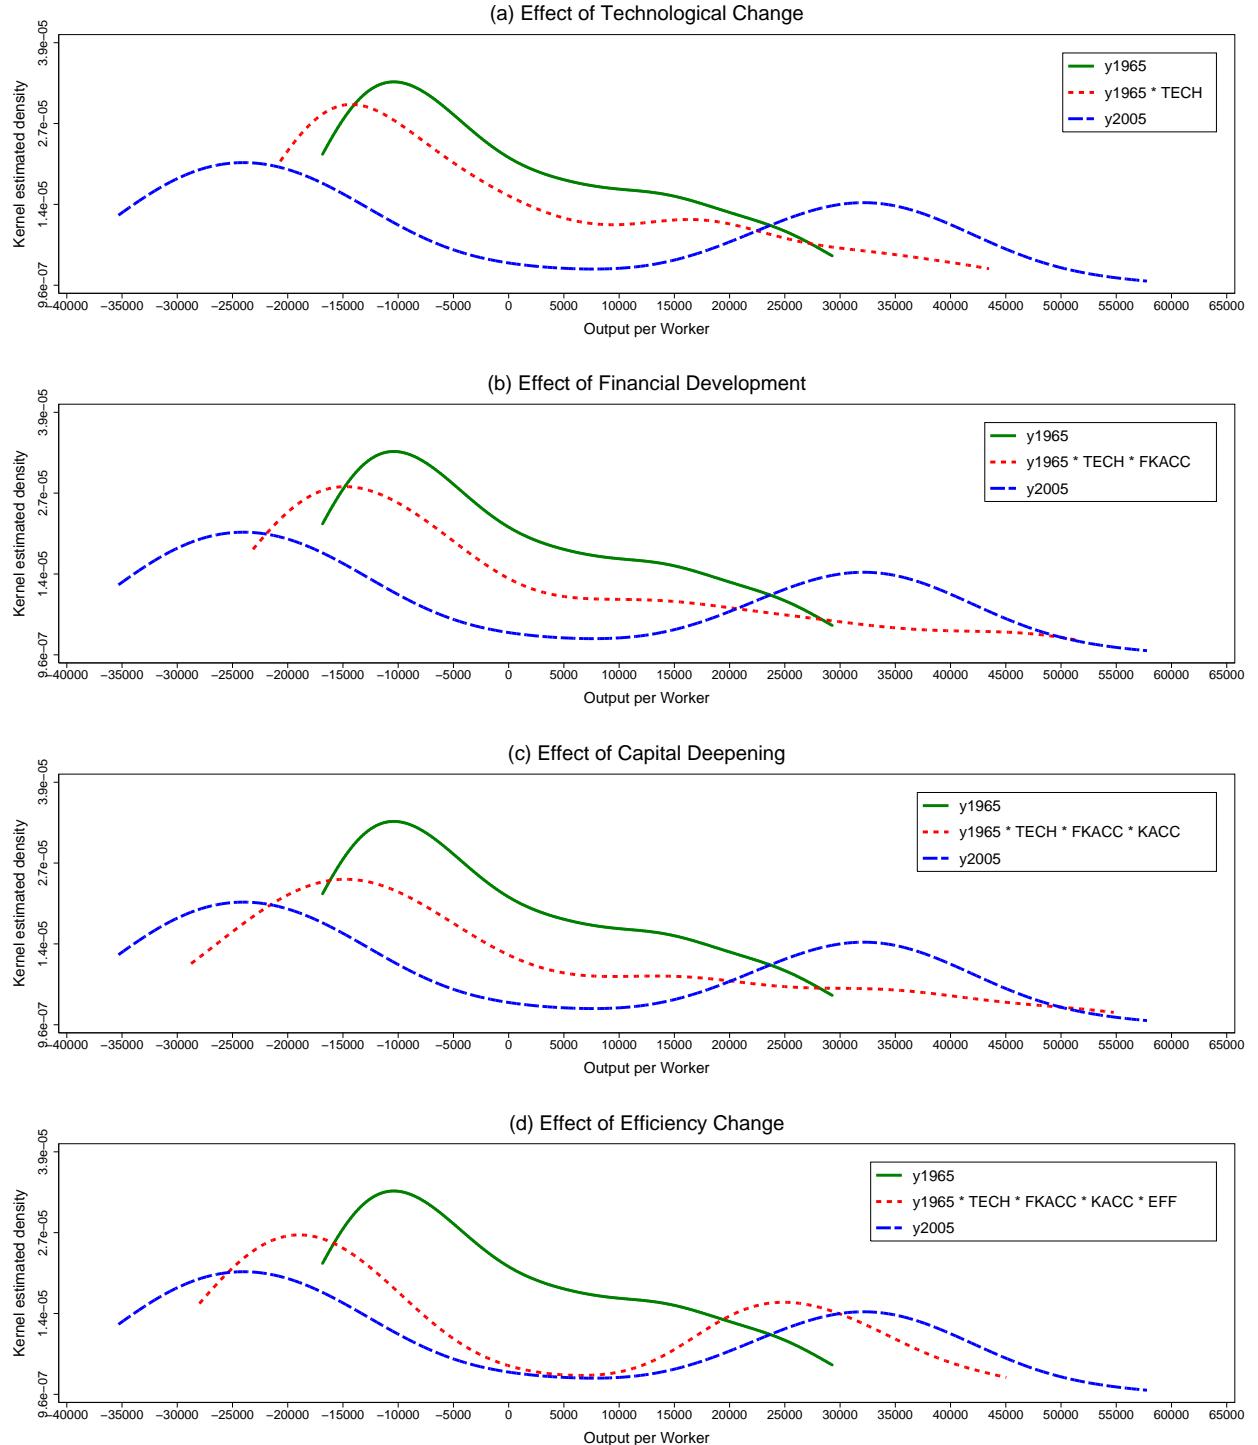

Figure A.42: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: TECH, FKACC, KACC and EFF

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of technological change, financial development, capital deepening, and efficiency change on the 1965 distribution.

## Appendix C.6 Private Credit by Deposit Money Banks and other Financial Institutions /GDP (CREDIT1, cut-off 20/80%)

Table A.37: Linking financial efficiency and financial development<sup>a</sup>

<sup>a</sup> The dependent variable is the log of the inverse of the financial efficiency measure. The coefficients on the financial development regimes (regions) represent the sum of coefficients and the respective numbers below the coefficients are p-values for the sum of coefficients

<sup>b</sup> Financial development falls into the low region if its value is lower than the 20<sup>th</sup> percentile of the financial development distribution

<sup>c</sup> Financial development falls into the middle region if its value is between the 20<sup>th</sup> and 80<sup>th</sup> percentiles (inclusive) of the financial development distribution

<sup>d</sup> Financial development falls into the high region if its value is greater than the 20<sup>th</sup> percentile of the financial development distribution

<sup>e</sup> p-value of the F-statistic on the three coefficients on financial development in the main regression.

Table A.38: Financial efficiency augmentation factors

| #  | Country        | 1965  | 2005  | #  | Country              | 1965  | 2005  |

Figure A.43: Distributions of financial development index, 1965 and 2005

*Notes:* Estimated 1965 and 2005 distributions of financial development index. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 2005 distribution and the dashed vertical line represents the 2005 mean value.

Figure A.44: Distributions of efficiency index, 1965 and 2005

*Notes:* Estimated 1965 and 2005 distributions of efficiency index. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 2005 distribution and the dashed vertical line represents the 2005 mean value.

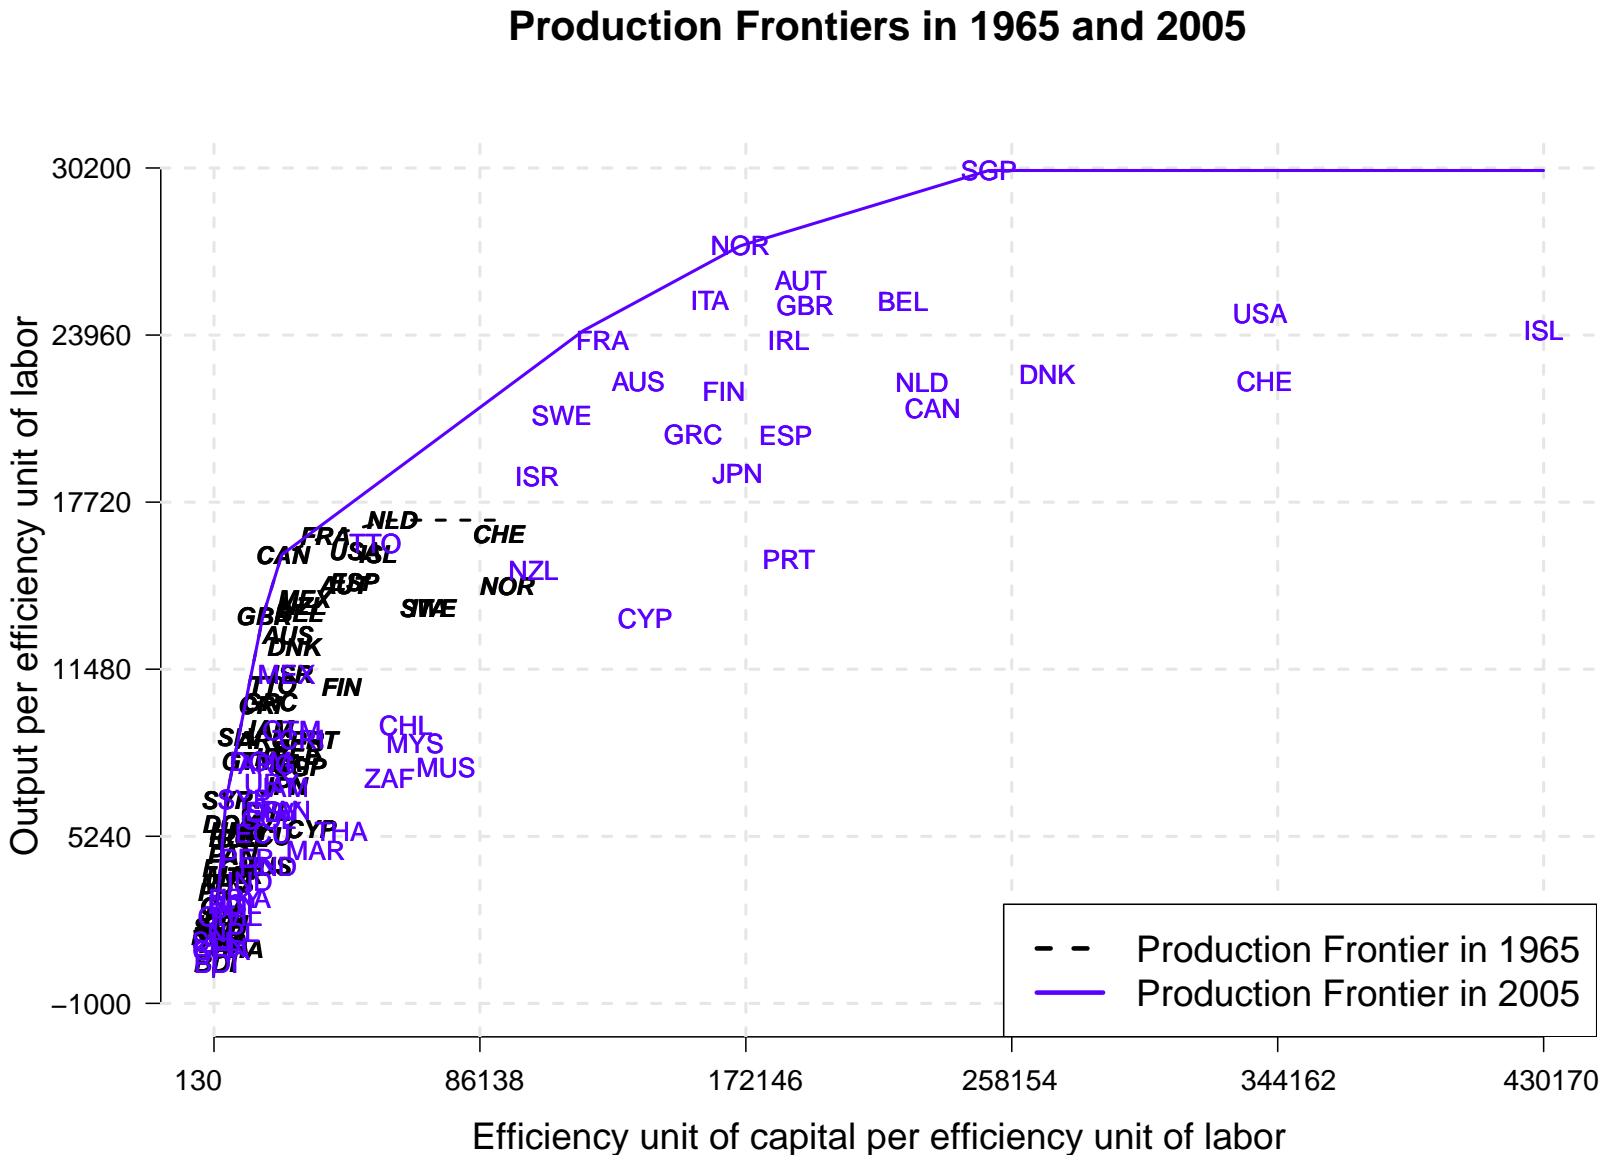

Figure A.45: Production frontiers in 1965 and 2005

*Notes:* The bold italic abbreviations show the 1965 observations and the normal font abbreviations show the 2005 observations. The dotted line represents the 1965 production frontier and the solid line presents the 2005 production frontier.

Table A.40: Percentage change of quinquepartite decomposition indices, 1965–2005

\* OECD countries as of 1990.

\*\* Japan, Malaysia, Singapore, and Thailand.

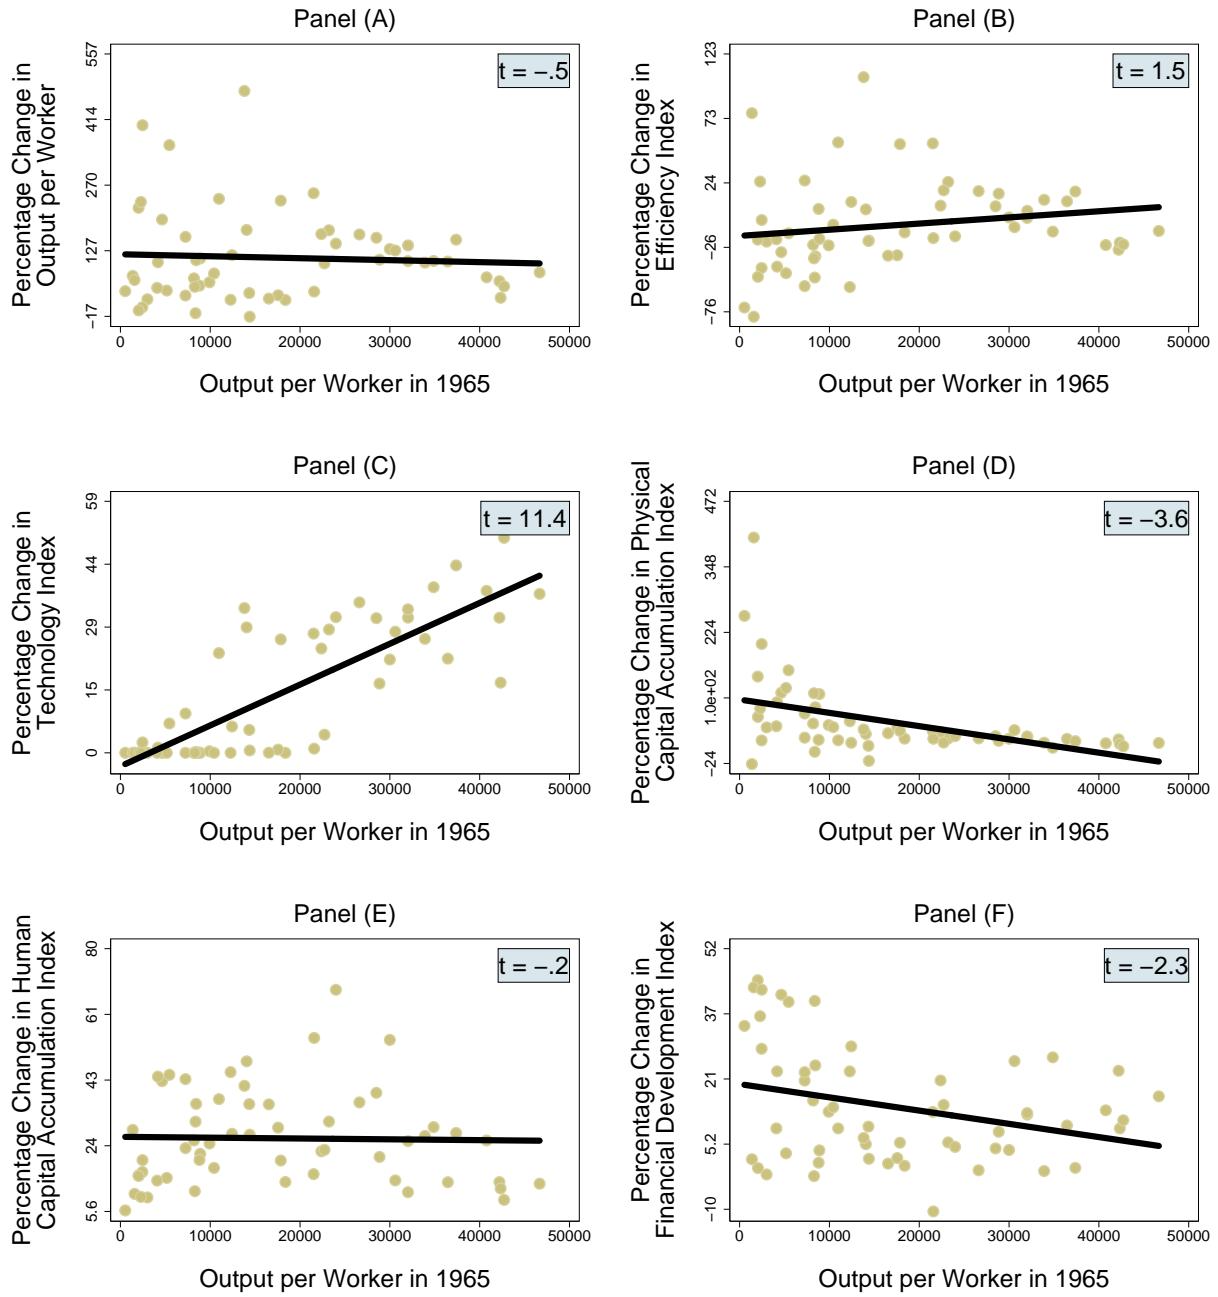

Figure A.46: Percentage change (from 1965 to 2005) in output per worker and five decomposition indices, plotted against output per worker in 1965.

Notes: Each panel contains a GLS regression line; the top right number in each panel is a  $t$ -statistic of a respective GLS regression based on “heteroskedasticity-consistent” estimators for the variance (Huber (1981); White (1980)).

Table A.42: Modality tests (*p*-values)

Notes: We used the bootstrapped Li (1996) test with 5000 bootstrap replications and the Sheather and Jones (1991) bandwidth.

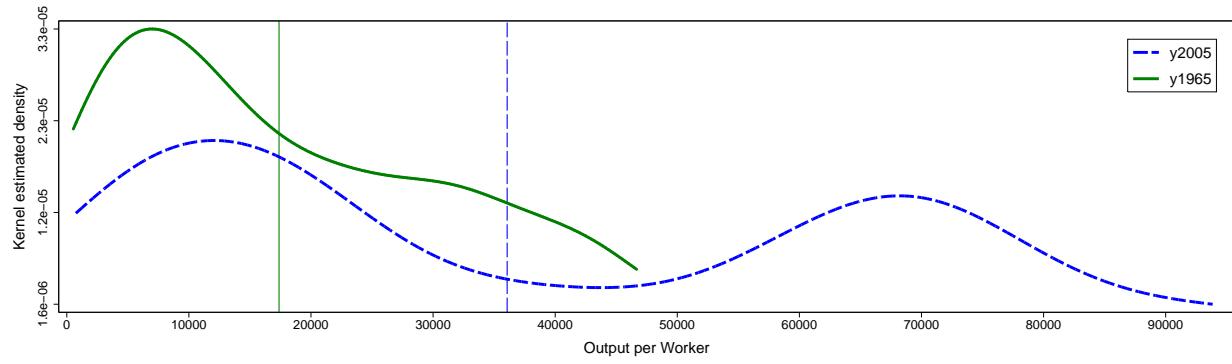

Figure A.47: Distributions of output per worker, 1965 and 2005

*Notes:* Estimated 1965 and 2005 distributions of output per worker. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 2005 distribution and the dashed vertical line represents the 2005 mean value.

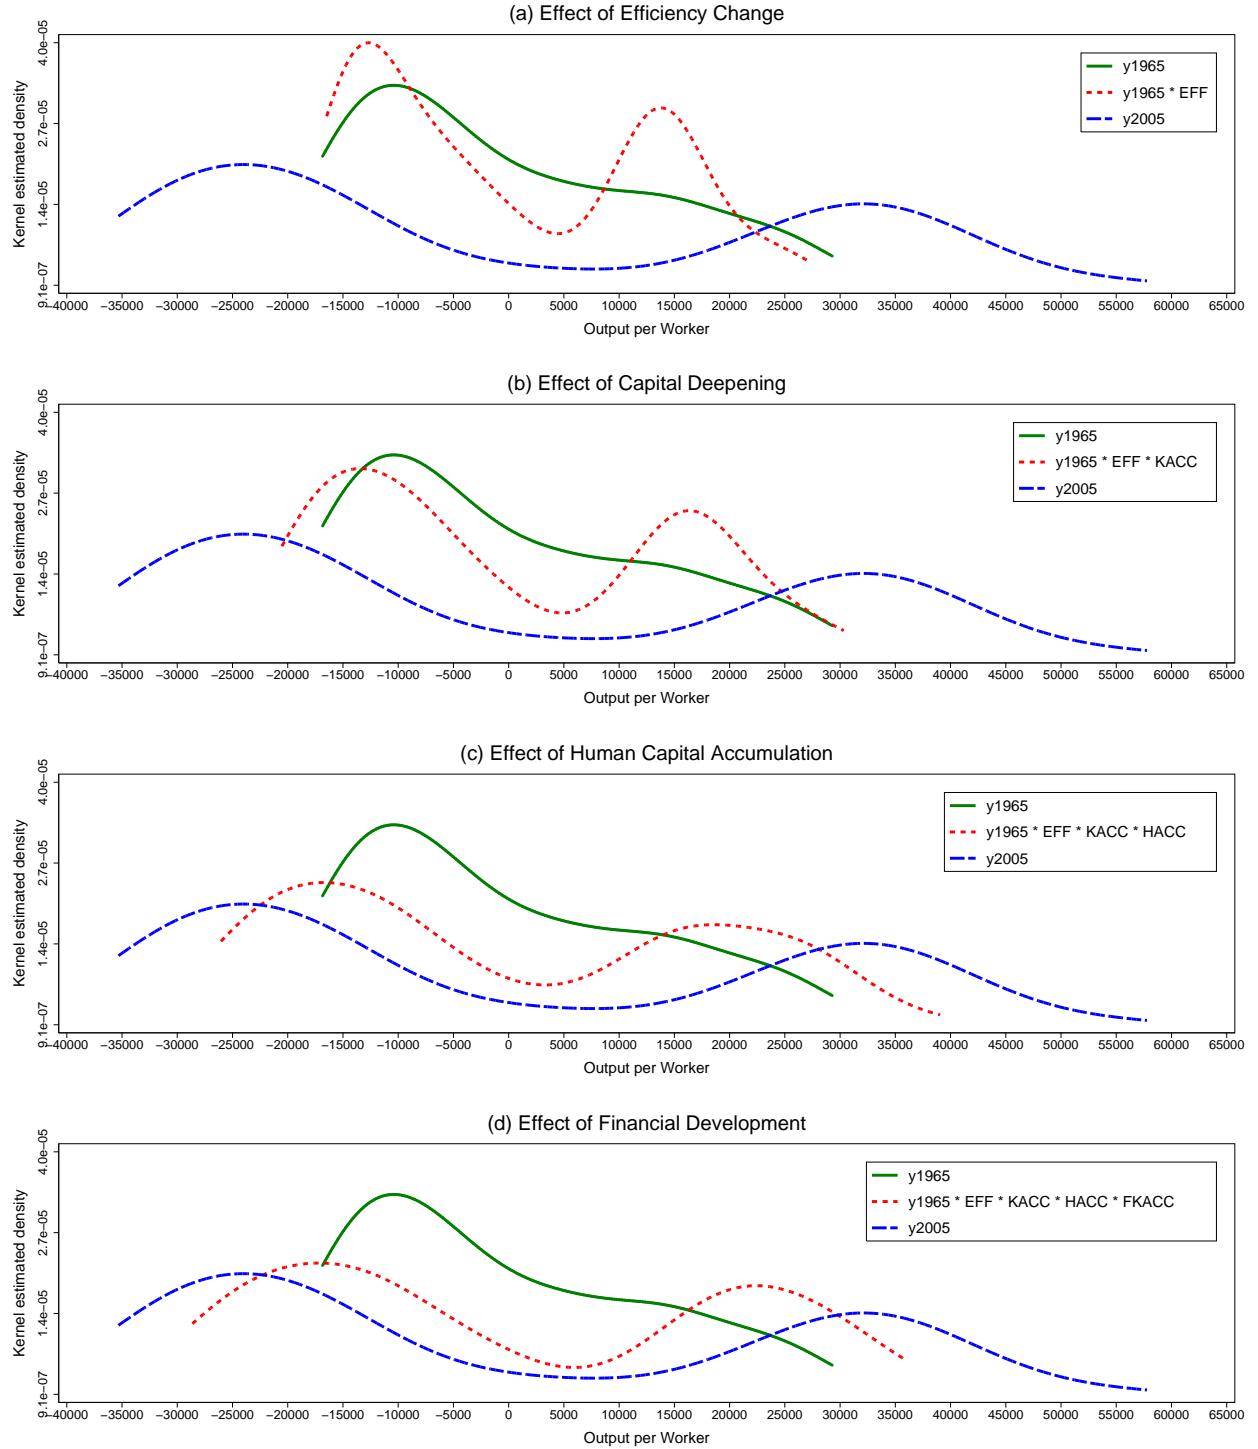

Figure A.48: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: EFF, KACC HACC, and FKACC

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of efficiency change, capital deepening, human capital accumulation, and financial development on the 1965 distribution.

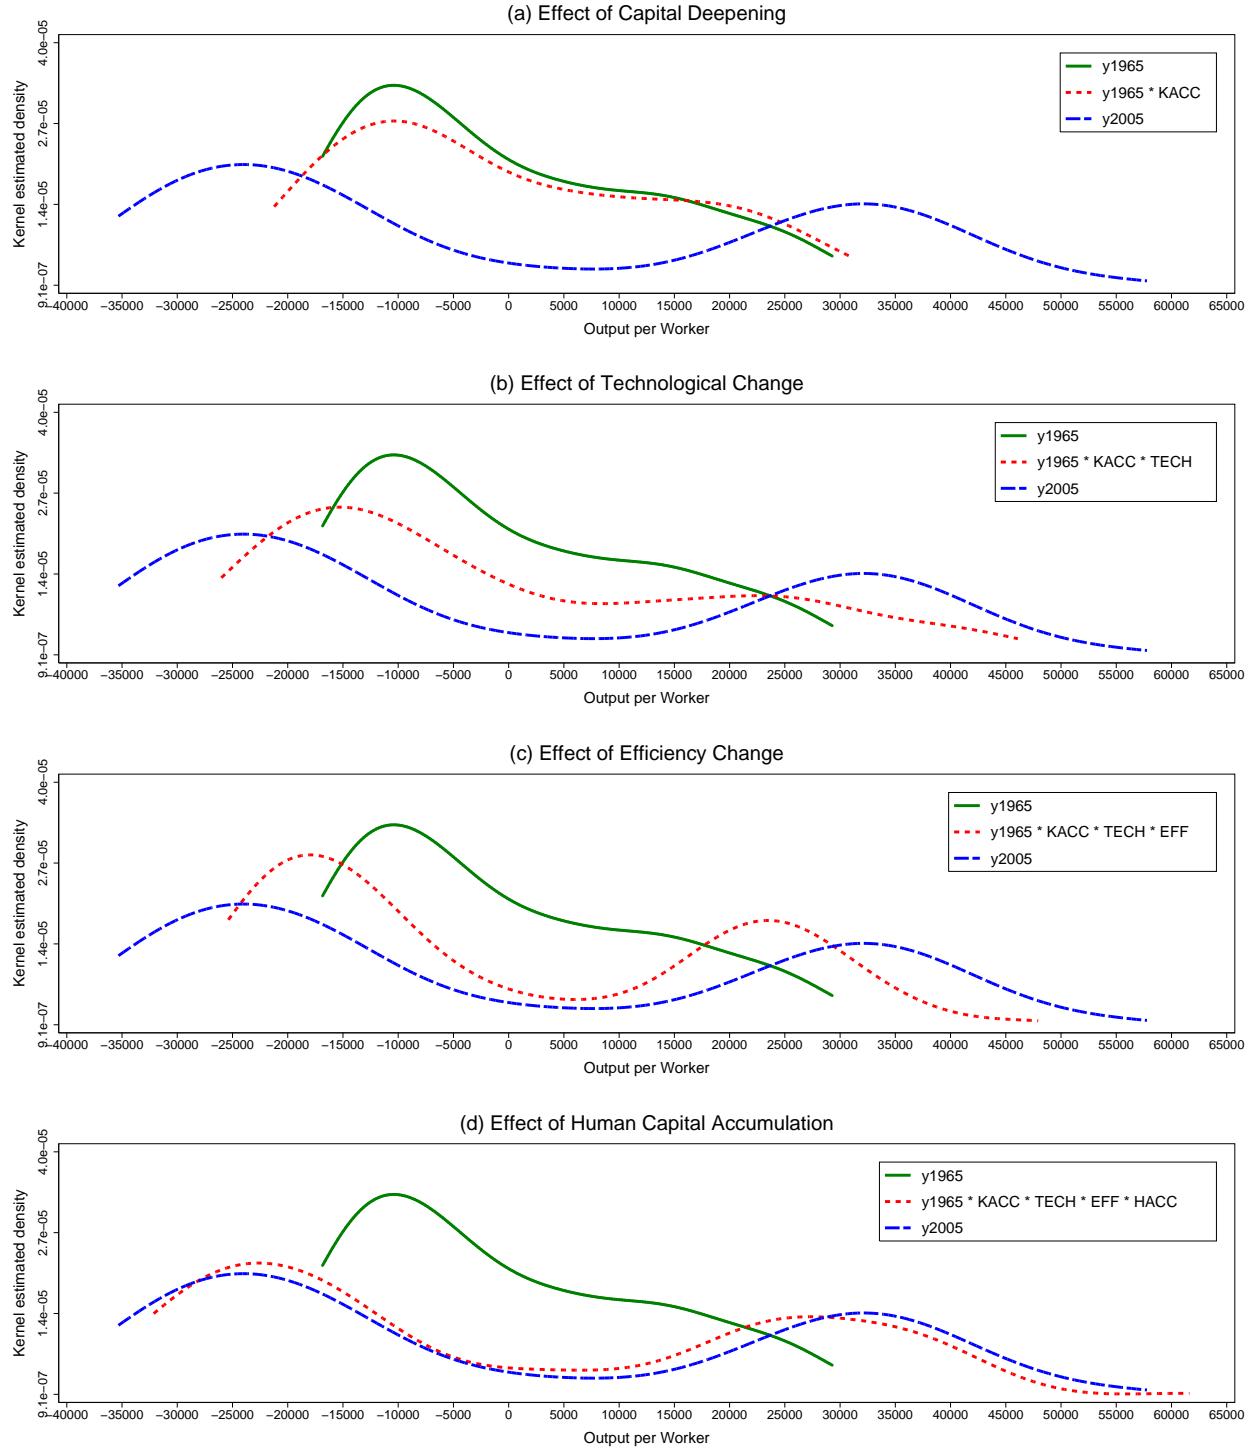

Figure A.49: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: KACC, TECH, EFF, and HACC

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of capital deepening, technological change, efficiency change, and human capital accumulation on the 1965 distribution.

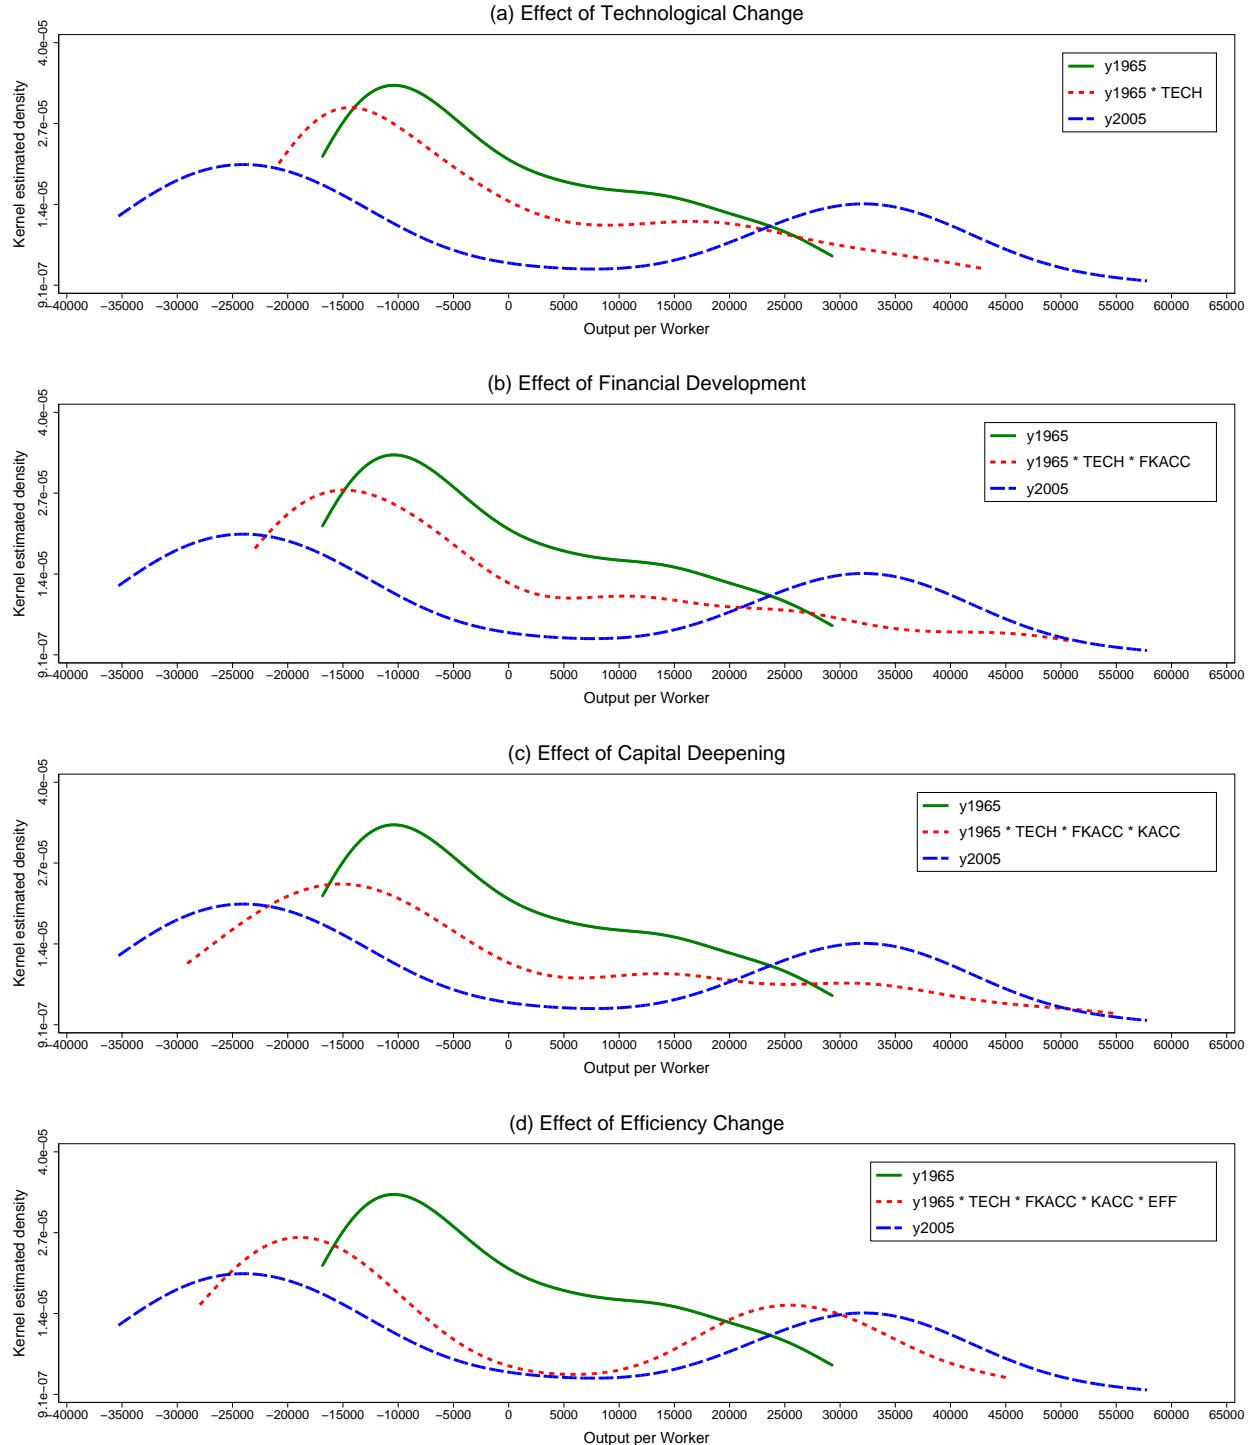

Figure A.50: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: TECH, FKACC, KACC and EFF

Notes: In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 2005 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of technological change, financial development, capital deepening, and efficiency change on the 1965 distribution.

Figure A.51: Distributions of financial development index, 1965 and 1990

*Notes:* Estimated 1965 and 1990 distributions of financial development index. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 1990 distribution and the dashed vertical line represents the 1990 mean value.

\* OECD countries as of 1990.

\*\* Japan, Malaysia, Singapore, and Thailand.

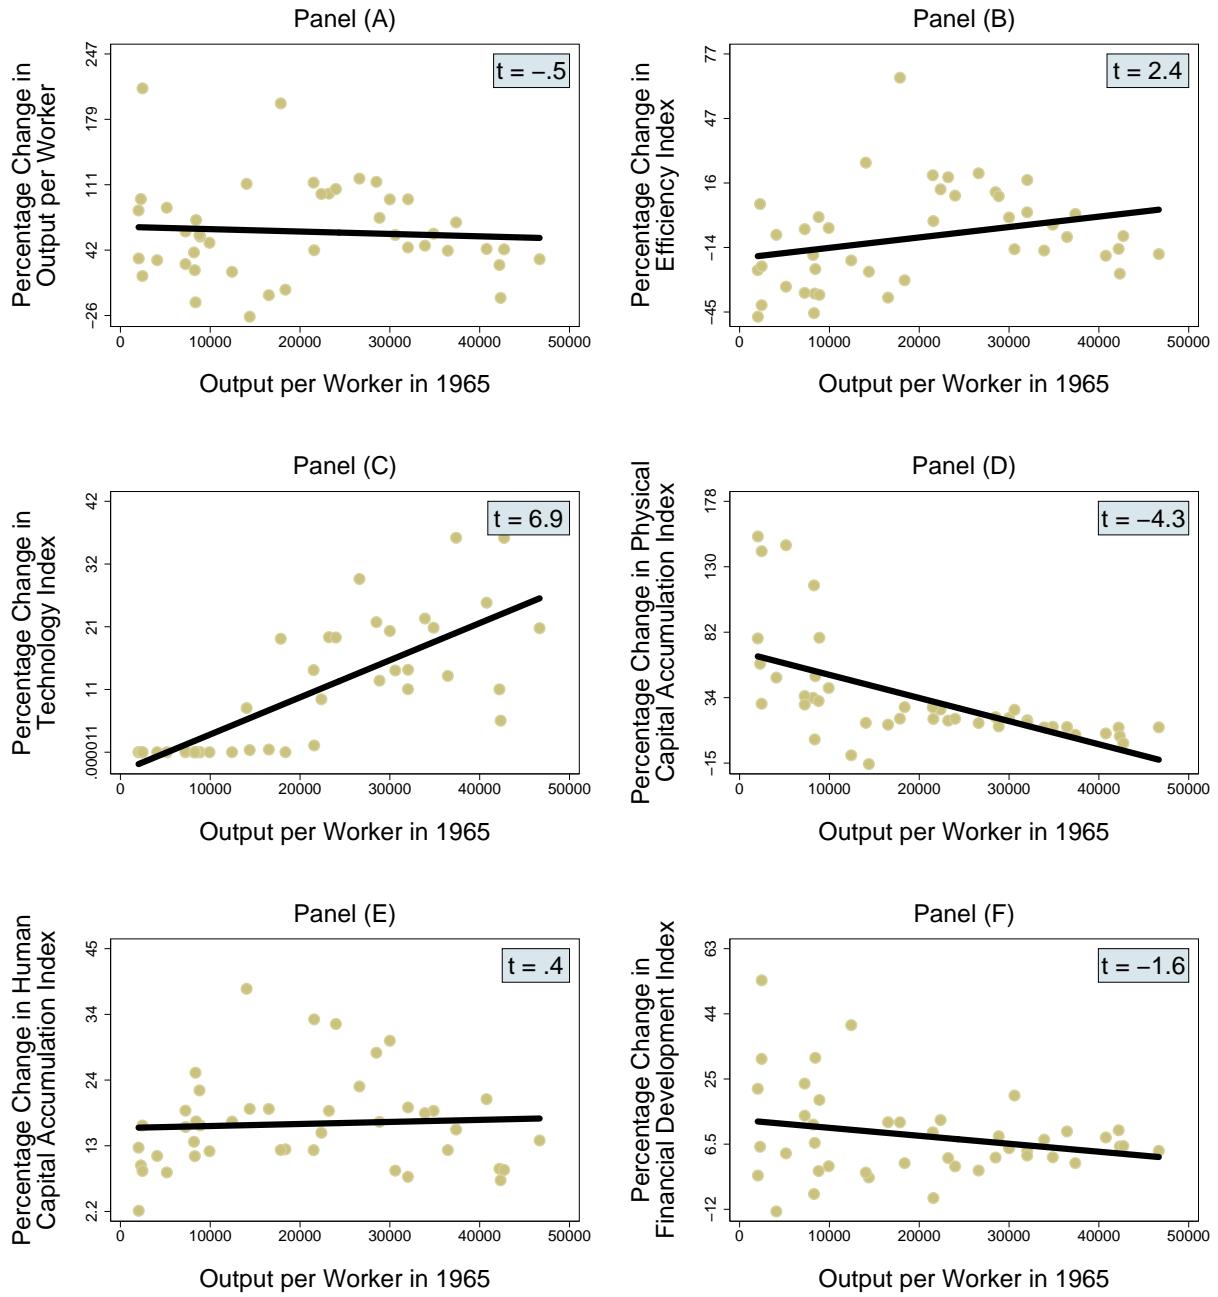

Figure A.54: Percentage change (from 1965 to 1990) in output per worker and five decomposition indices, plotted against output per worker in 1965.

Notes: Each panel contains a GLS regression line; the top right number in each panel is a  $t$ -statistic of a respective GLS regression based on “heteroskedasticity-consistent” estimators for the variance (Huber (1981); White (1980)).

Table A.48: Modality tests (*p*-values)

|    | $H_0$ : Distribution has one mode<br>$H_A$ : Distribution has more than one mode | Bootstrap<br><i>p</i> -value |

Notes: We used the bootstrapped Li (1996) test with 5000 bootstrap replications and the Sheather and Jones (1991) bandwidth.

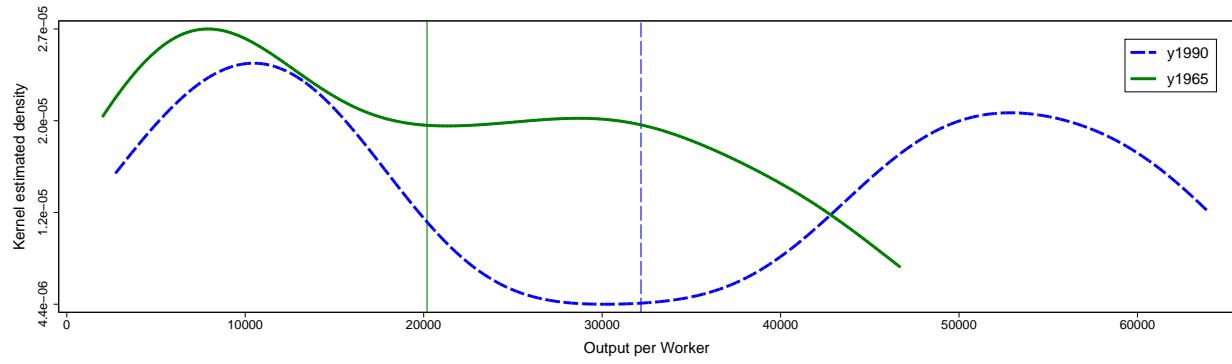

Figure A.55: Distributions of output per worker, 1965 and 1990

*Notes:* Estimated 1965 and 1990 distributions of output per worker. The solid curve is the estimated 1965 distribution and the solid vertical line represents the 1965 mean value. The dashed curve is the estimated 1990 distribution and the dashed vertical line represents the 1990 mean value.

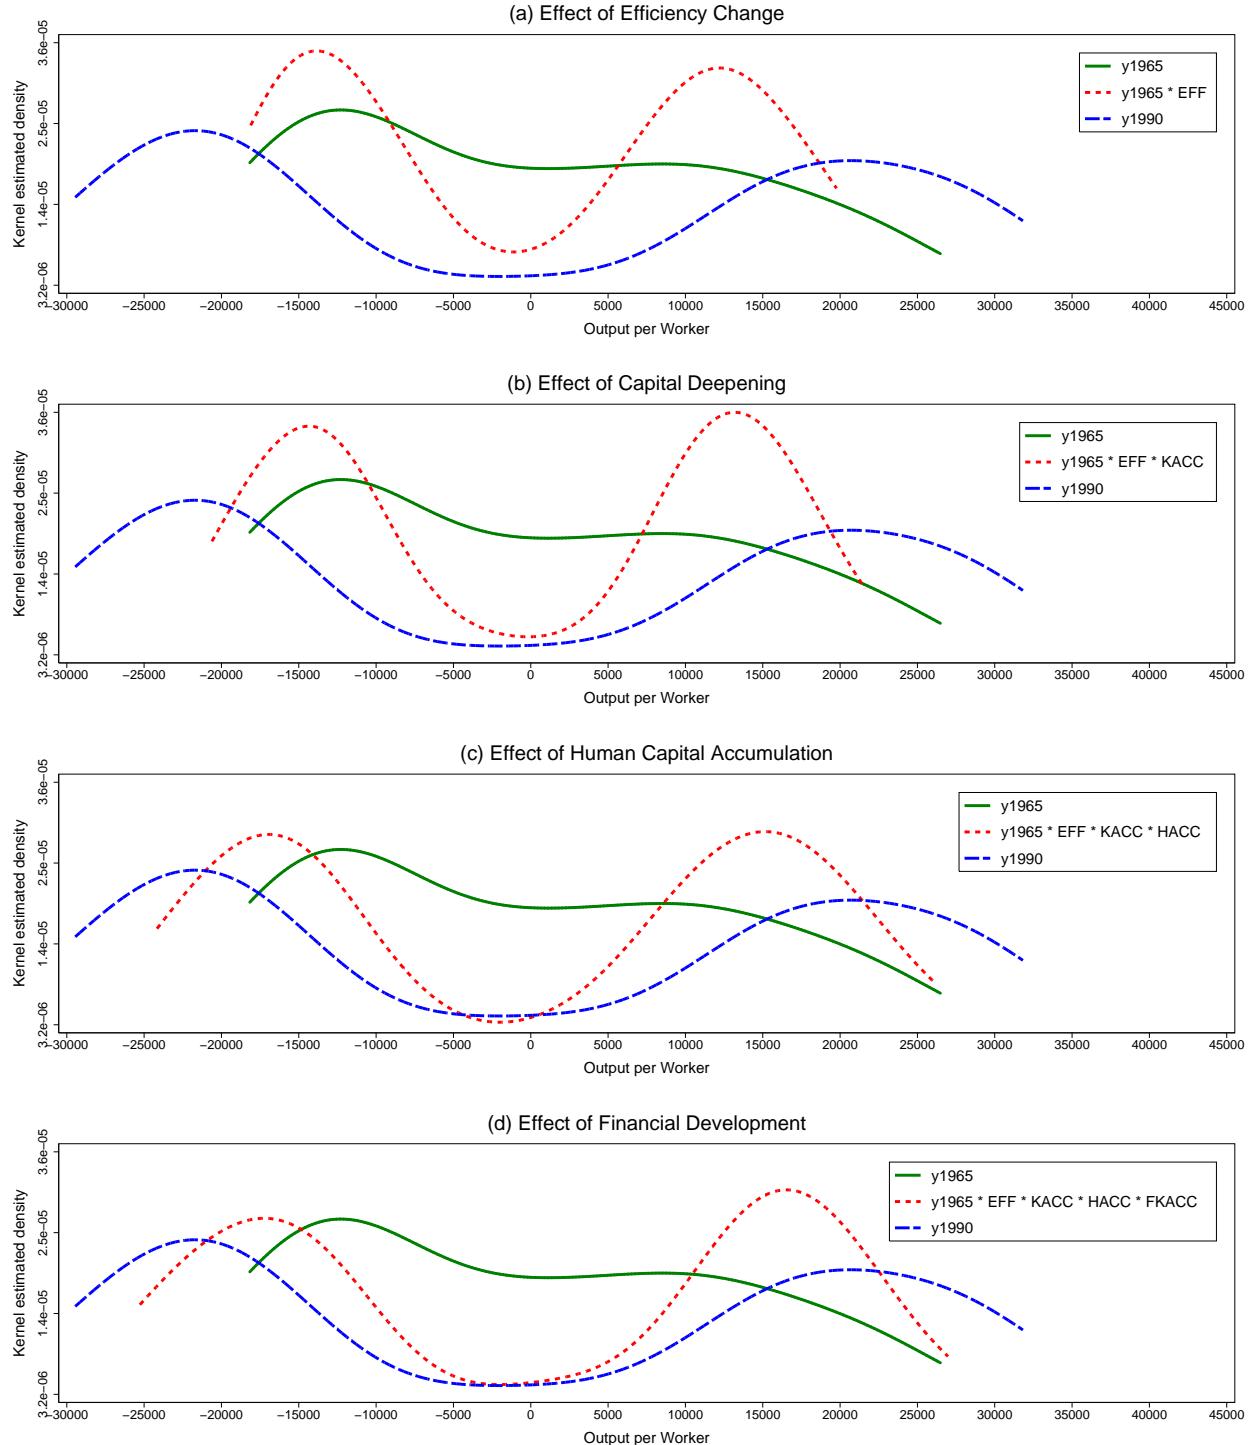

Figure A.56: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: EFF, KACC HACC, and FKACC

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 1990 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of efficiency change, capital deepening, human capital accumulation, and financial development on the 1965 distribution.

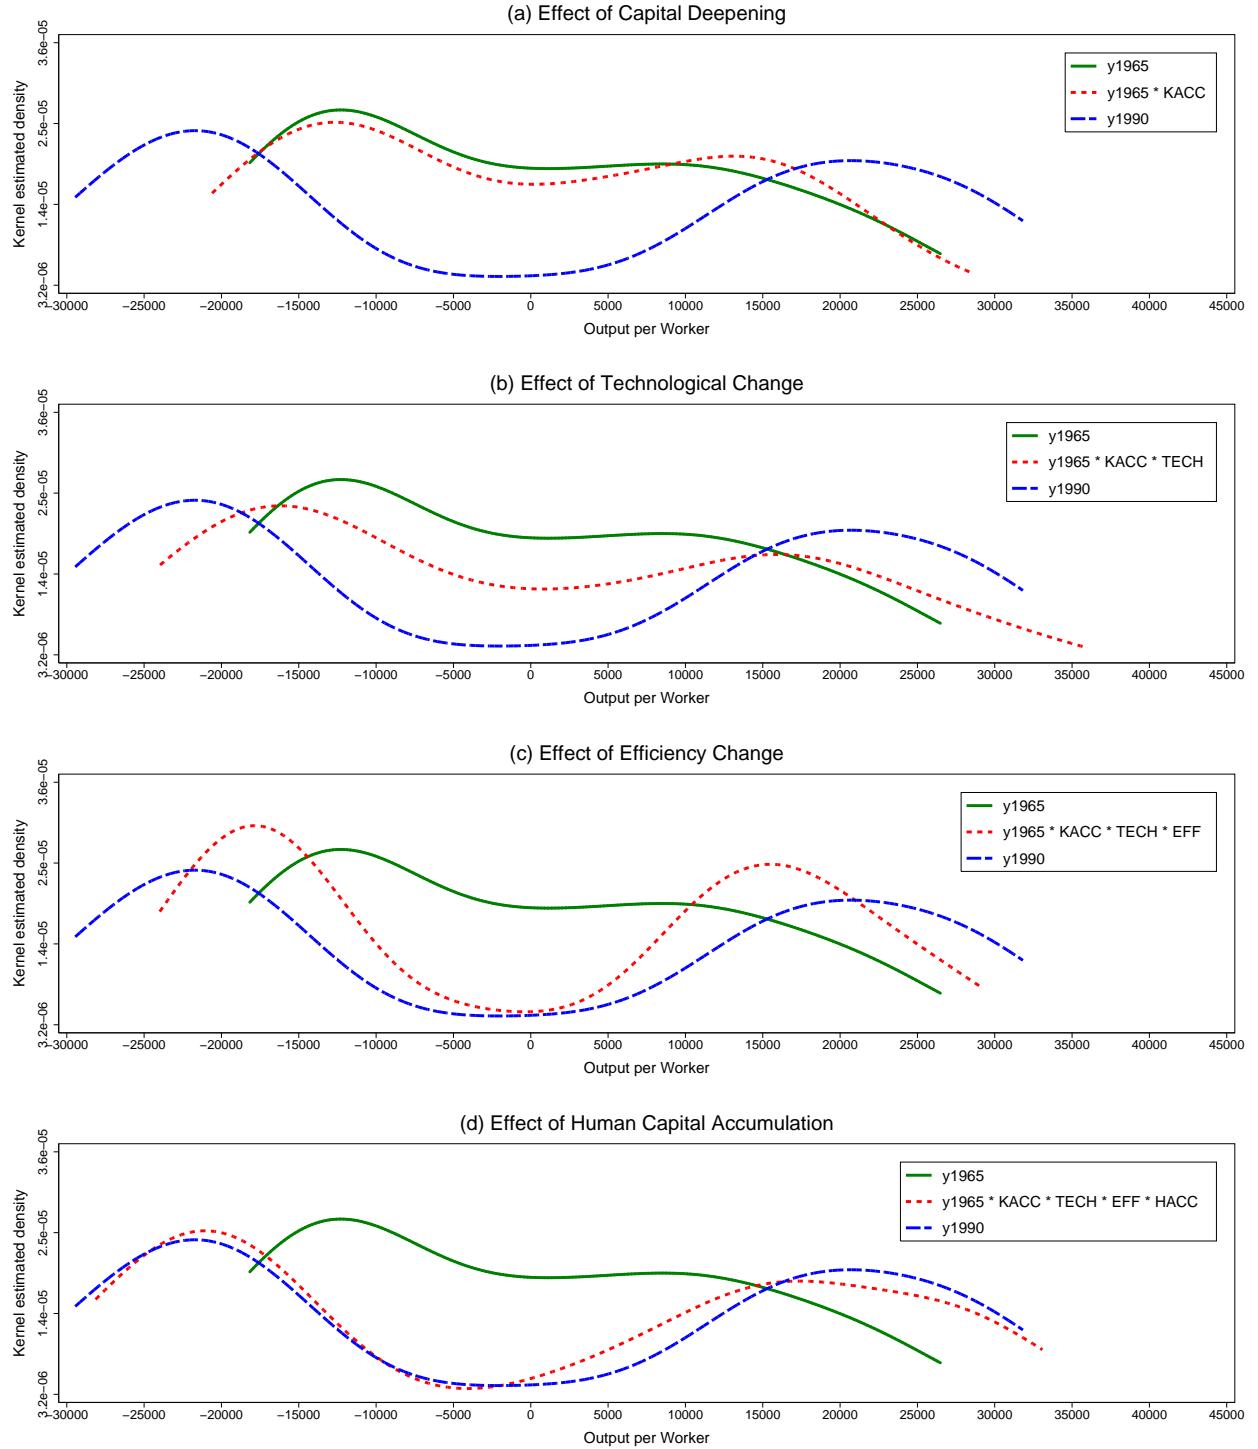

Figure A.57: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: KACC, TECH, EFF, and HACC

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 1990 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of capital deepening, technological change, <sup>120</sup>efficiency change, and human capital accumulation on the 1965 distribution.

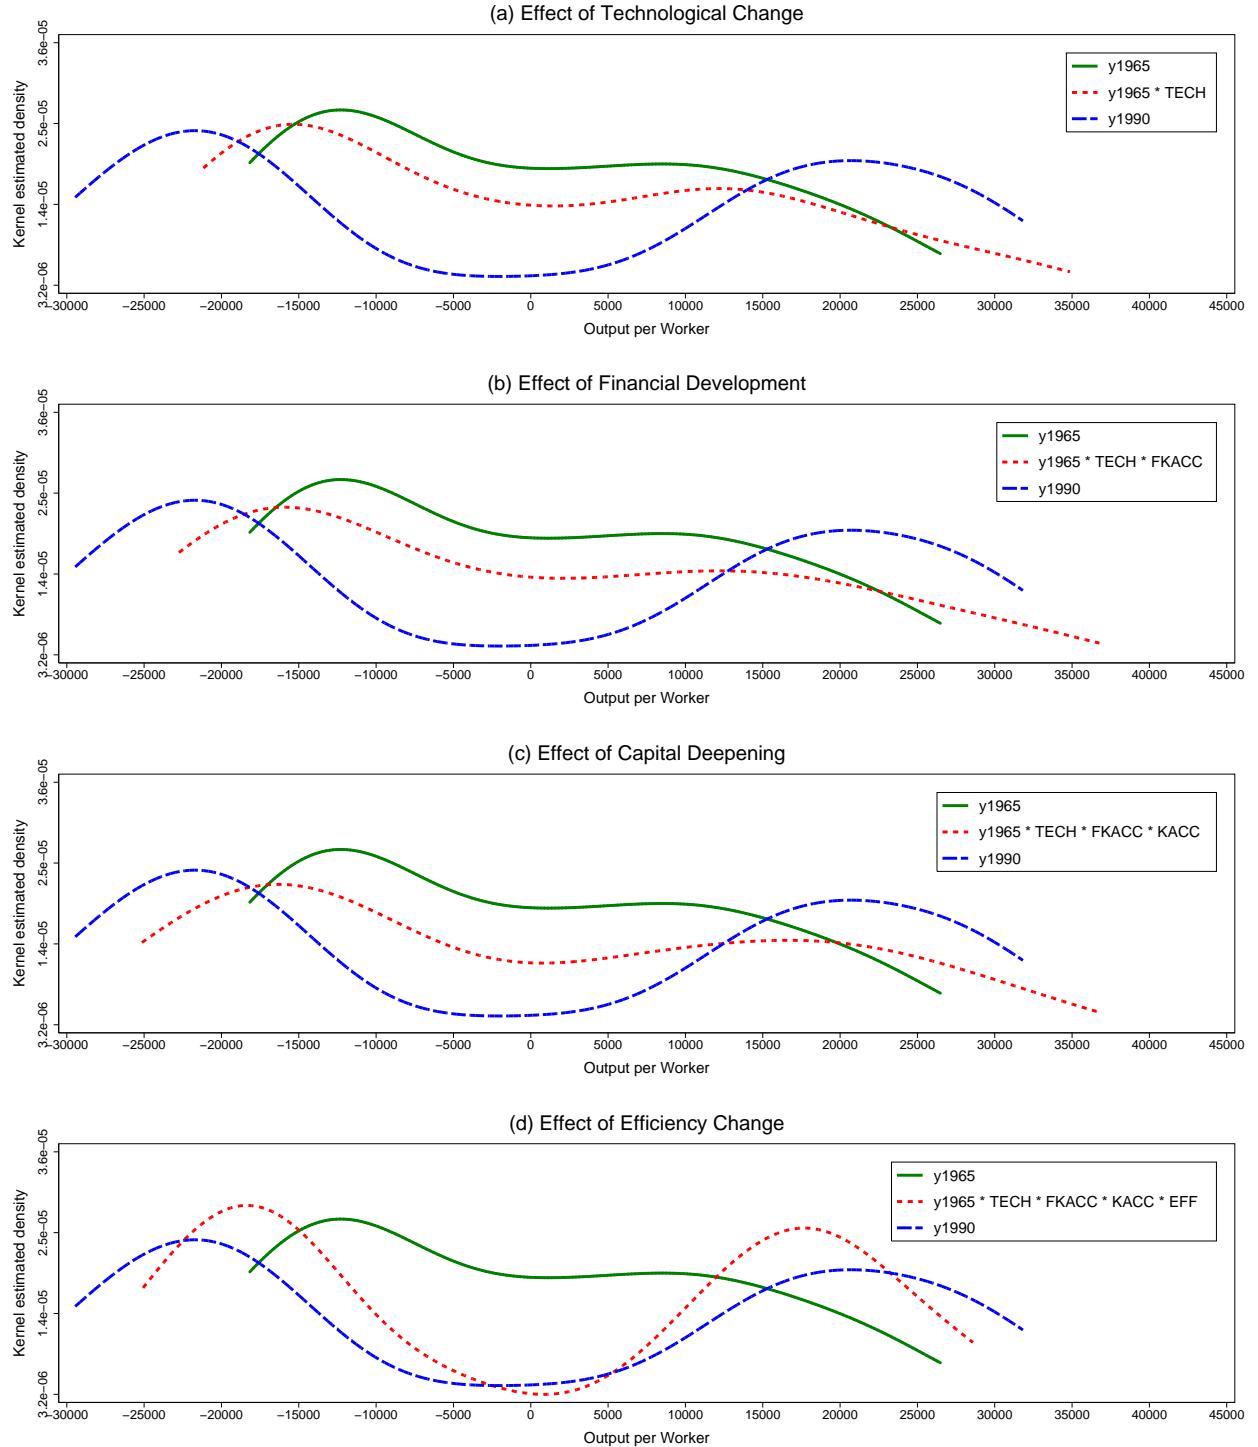

Figure A.58: Counterfactual Distributions of Output per Worker. Sequence of introducing effects of decomposition: TECH, FKACC, KACC and EFF

*Notes:* In each panel, the solid curve is the actual 1965 distribution and the dashed curve is the actual 1990 distribution. The dotted curves in each panel are the counterfactual distributions isolating, sequentially, the effects of technological change, financial development, capital deepening, and efficiency change on the 1965 distribution.

## Production Frontiers in 1984 and 2005

Figure A.66: Production frontiers in 1984 and 2005, INST1 is Law and Order, INST2 is Democratic Accountability

*Notes:* The bold italic abbreviations show the 1984 observations and the normal font abbreviations show the 2005 observations. The dotted line represents the 1984 production frontier and the solid line presents the 2005 production frontier.
